ABSTRACT OF THE DISSERTATION

A Grammar of the Serrano Language

by

Kenneth Cushman Hill

Doctor of Philosophy in Linguistics
University of California, Los Angeles, 1967
Professor William O. Bright, Chairman

The grammar of Serrano, a Uto-Aztecan language of Southern California, is described as consisting of a base component, which specifies deep structure, and a transformational component, which maps deep structure into surface form.

The base component consists of a categorial component and a lexicon. The categorial component is stated in terms of context-free phrase-structure rules and context-sensitive rule schemata that map lexical categories into complex symbols (CS). These categorial rules generate

Phrase-markers of strings consisting of various occurrences of CS, which mark the positions of lexical cate-gories, and of grammatical formatives. The lexicon consists of syntactic redundancy rules and of lexical entries, of which only a representative sample are provided. A major emphasis is on the distinction between strict subcategorization rules and selectional rules, which allows for the principled development of the context-free phrase-structure rules.

The transformational component consists of the transformational cycle, having to do with agreements and embedded Sentences; a set of pre-morphological transformations, which adjust specific syntactic formatives and features, including those introduced by the agreement transformations of the transformational cycle; a morphological component, which relates non-lexically introduced material to phonological form; a set of post-morphological transformations, which include late restructurings and reorderings and transformations whose effects are almost entirely phonological; and a set of phonological rules, stated in distinctive feature terms, the output of which is identical with a systematic phonetic notation.

O. INTRODUCTION

O.1. The Serrano Language. Serrano is a hitherto undescribed Uto-Aztecan language. Various Serrano forms have appeared in a number of studies. The fullest lists are in Gatschet (1879), where Serrano is called "Takhtam," Kroeber (1907), and Kroeber (1909); and the most recent publication including Serrano forms is Miller (1961). Sapir used Serrano forms, mostly from Kroeber, in his demonstration of Uto-Aztecan (Sapir 1913-1914); but there has never been any systematic analysis of any aspect of Serrano.

The present description of Serrano is based on field work done during the summer of 1963 and in December, 1964, with support from the American Council of Learned Societies, whose assistance is gratefully acknowledged. I am also greatly indebted to Mrs. Sarah Morongo Martin, my principal informant, and to Louie Marcus, both of the Morongo Indian Reservation at Banning, California, for working patiently with me on their language.

Serrano, which aboriginally was spoken by perhaps 1500 people (Kroeber 1925:617), is spoken by only about half a dozen people at present. It is the last surviving language of the Serrano group of languages, which have been classified as one division of the Southern Californian branch of Uto-Aztecan (Kroeber 1925:577). The Southern

Californian languages have been classified as part of a linguistic unity within Uto-Aztecan known as Shoshonean (Kroeber 1925:575), but this unity has been called into question (Whorf 1935:608; Miller 1964), and perhaps reexamination of the inclusion of Serrano in the Southern Californian branch may also be in order.

Other than Serrano, the Serrano included Kitanemuk, Alliklik, and Vanyume. Presumably all three are extinct. Whether these groups spoke distinct but closely related languages or merely dialectal variants of the same language as Serrano seems impossible to determine at the present.

Serrano was spoken around the San Bernardino Mountains. With the advent of the Missions, some Serranos retreated into the mountains, whence their name, Spanish for 'mountaineer'. The Serranos have no special name for themselves. The term [ta:qtam], the "Takhtam" of Gatschet (1879), means 'people', and is applied to all Indians. The name used for those Serranos at the Morongo Reservation at Banning, California, where most of the present-day Serranos live, is [ma:rina'iam] 'Morongos', but this term refers only to members of one lineage or local group. Other local groups of Serranos still mentioned are [mihia:'niam], ['atii:abiatam], and [mamai:tam]. For the names of other groups, see Benedict (1924:368-369).

0.2. A Note on Transcription. Serrano examples are cited in either a systematic phonetic or a morphophonemic transcription. The latter is indicated by underlining. (Underlined forms beginning with capital letters are non-phonological tags for specific grammatical formatives.) Spaces between letters in the phonetic transcription correspond to morphophonemic word boundaries. Such spaces have no phonetic value, but rather are intended as a help for the reader. Not indicated in the phonetic transcription is the consonant deletion resulting from the morphophonemic rule $C_1\# C_1 \Rightarrow C_1$ (7.56).

The sounds of Serrano may be charted as follows:

```
Vowel length: [:]

Medial pause: [,]

Rising pitch (plus pause): [?]

Sentence end: [.] (not indicated after final [?])
```

The consonants [c, s, h, r] are apicoalveolar, $[b, d, r, y, g, w, 1, 1^Y]$ are approximants (Ladefoged 1964:25). [c, č] are affricated, and [q] is often affricated noninitially. In some positions [q] seems to be in free variation with [X], especially in rapid speech (but not all instances of [X] are in free variation with [q]). ['] represents the glottal stop.

The vowels $[\frac{1}{7}, \frac{1}{4}]$ are retroflexed; [0] is rounded and retroflexed.

A number of symbols are used only in the morphophonemic transcription. To be noted in particular are the
stress mark _; the transition +, which serves to block morphophonemic rules affecting certain segments after vowels;
the unrounded mid-central vowel _a; and the boundary symbol
#. C and V represent respectively any consonant and any
vowel.

0.3. Theoretical Orientation. This statement of the grammar of Serrano is in terms of my understanding of the model for syntactic description proposed by Chomsky (1965). It is an attempt to characterize the syntactic competence of a speaker of Serrano. The statement of this competence is necessarily limited because of the small amount of data available, because of my own limited understanding of the language, and because the lexical material presented here is only a representative sample.

The syntactic component of a transformational grammar consists of the base component and the transformational component. The base component consists of the categorial component and the lexicon. The categorial component is stated in terms of context-free phrase-structure (PS) (branching) rules (section 1) and context-sensitive rule schemata (section 2) that map lexical categories into Complex Symbols (CS) in terms of the following convention:

...we impose the following general condition on strict subcategorization rules: each such rule must be of the form

(47) A \rightarrow CS/ α - β , where α A β is a σ ,

where, furthermore, σ is the category symbol that appears on the left in the rule $\sigma \rightarrow \cdots \land A \cdots$ that introduces A. (Chomsky 1965:99; Chomsky's emphasis)

If this condition of strict local subcategorization is adopted as a general condition on the form of grammar, then the strict subcategorization rules can simply be given in the form

 $(48) \quad A \rightarrow CS$

the rest being supplied automatically by a convention. (Chomsky 1965:100)

These categorial rules generate Phrase-markers of strings consisting of various occurrences of CS, which mark the positions of lexical categories, and of grammatical formatives (Chomsky 1965:122). The lexicon (also section 2) consists of the lexical entries, which are mapped on to appropriate Phrase-markers as terminal symbols, and of syntactic redundancy rules (Chomsky 1965:168). The transformational component consists of transformations, which map deep structures into surface structures by adjusting terminal symbols and restructuring Phrase-markers. In the view of grammar adopted here, no transformation is optional, such that the transformational component makes no semantic contribution. This wording differs somewhat from Chomsky's:

...the only contribution of transformations to semantic interpretation is that they interrelate Phrase-markers (i.e., combine semantic interpretations of already interpreted Phrase-markers in a fixed way). It follows, then, that transformations cannot introduce meaning-

bearing elements (nor can they delete lexical items unrecoverably...). (1965:132; Chomsky's emphasis)

The recursive property of language is a feature of the base component. Chomsky (1965:137) suggests that all recursiveness be handled by various reintroductions of the axiomatic symbol S ("Sentence") at appropriate places in the PS rules.

...the recursive property is a feature of the base component, in particular, of the rules that introduce the initial symbol S in designated positions in strings of category symbols. There are, apparently, no other recursive rules in the base.

It seems, however, not to be the case that there are no recursive rules in the base other than those which reintroduce the initial symbol S. In particular, at least the Numeral-Phrase must be reintroduced within itself (1.20) and the Nominal-Phrase within itself (1.18).

Once these examples of recursiveness involving symbols other than the axiomatic S were introduced into the PS rules, coordination was reexamined, with the result that coordinated elements are introduced recursively in a variety of places (1.1, 1.2, 1.5, 1.6, 1.16). The following convention is used: all rules containing $[\Sigma]^*$, where Σ is any symbol or string of symbols, are rule schemata which allow for a repetition of Σ \underline{n} times, where $\underline{n} \geq 1$.

This approach to coordination is radically different from Chomsky's:

Thus wherever we have coordination, some category is coordinated \underline{n} times in the matrix sentence, and \underline{n} occurrences of matched sentences are independently generated by the base rules. (1965:224)

It will be noted, however, that the present formulation of coordination seems to handle some of the problems that Chomsky's is unable to:

Notice that the schemata that underlie coordination... also provide infinite generative capacity, but here too the true recursive property can apparently be limited to the schema $S \rightarrow S\#S\#...\#S$, hence to rules introducing "propositions."

This formulation leaves unexplained some rather marginal phenomena (e.g., the source of such expressions as "very, very, ..., very Adjective"[)] and some more significant ones (e.g., the possibility of iterating Adverbials and various kinds of parenthetic elements, the status of which in general is unclear). (1965:225)

Probably Adjective=Phrases should also be recursively introduced within the Predicate (1.6), to account for Sentences which might be like the English "The dog is black and white all over," which surely is not based on the pair of Sentences "The dog is black all over" and "The dog is white all over." However, Serrano data on this particular problem are missing.

The problem of stylistic reordering is seen as excluded from transformational treatment. Chomsky observes that

grammatical transformations do not seem to be an appropriate device for expressing the full range of possibilities for stylistic inversion. (1965:126)

In general, the rules of stylistic reordering are very different from the grammatical transformations, which are much more deeply embedded in the grammatical system. It might, in fact, be argued that the former are not so much rules of grammar as rules of performance. (1965:127)

Serrano word order is remarkably free. The sentences of (0.3a) all contain the same morphemic material and all unambiguously mean 'I saw a red moon'.

(0.3a) nɨ' mɨa:çi şɨri:'nka'ti hihi.

I-PAST MOON-ACC RED-ONE-ACC SEE

nɨ' mɨa:çi hihi şɨri:'nka'ti.

nɨ' şɨri:'nka'ti mɨa:çi hihi.

nɨ' şɨri:'nka'ti hihi mɨa:çi.

nɨ hihi mɨa:çi şɨri:'nka'ti.

nɨ hihi şɨri:'nka'ti mɨa:çi.

mɨa:çi nɨ hihi şɨri:'nka'ti.

mɨa:çi sɨri:'nka'ti nɨ hihi.

şɨri:'nka'ti nɨ hihi mɨa:çi.

şɨri:'nka'ti nɨ hihi mɨa:çi.

hihi nɨ' mɨa:çi şɨri: 'nka'ti.
hihi nɨ' şɨri: 'nka'ti mɨa:çi.

Also omitted from grammatical treatment is the question of optional deletions. Since only "recoverable deletions" are to be permitted in a grammar (Chomsky 1965:122), any rules which delete lexical items unrecoverably must surely be outside those of grammar, and therefore, presumably, should also, together with the rules of optional reordering mentioned above, be handled by an as yet unformalized theory of performance. An example of lexical deletion, together with its probable source Sentence inferred from context is:

(0.3b) 'imi' tam' payika'.

YOU DUB-YOU AWAY

'You'll (go) away.'

< 'imi' tam' payika' mi:b.
YOU DUB-YOU AWAY GO-FUTURE</pre>

(In context, this Sentence immediately follows and is an expansion from ['imi' tam' mi:b.] 'You'll go.')

1. PHRASE-STRUCTURE RULES

1.0. Start with: #S#

S, representing the category "Sentence," is the axiomatic initial symbol of the grammar (Chomsky 1965:66). # is the boundary symbol and is regarded as a grammatical formative (Chomsky 1965:66), that is, # is not further rewritten in the base component. Every Sentence begins and ends with #.

1.1. S
$$\rightarrow$$
 { Interjection S ([#Conj^S#]*)}

Interjection (1.1.1, 2.7)
S = Sentence (1.2)
Conj = Conjunction (2.8)

1.1.1. Interjections are introduced in this first PS rule. They are single-word Sentences with no internal grammatical structure. Interjections cannot be conjoined either with themselves or with any other sort of syntactic material. Examples of Interjections are: #ha:h# 'yeah', #now# 'no', #'eya'# 'hey!'. Possibly Interjections should simply be ignored in a syntactic description.

- 1.1.2. PS rule 1.1 allows for all coordinated Sentences and also for all disjunctively coordinated constituents smaller than the Sentence, that is, those coordinate constructions with the Conjunction #ha:# 'or'. Examples of these two kinds of coordination are:
- (1.la) S['ibi' tihtiyič'i:m'qqu'] Conj['ami']

 THIS JOB END-MOTION AND

 S[m moč mana'q].

 THEY AGAIN RETURN

 'This job comes to an end and they go home again.'
- (1.1b) wahmac pihpa' Num[mahac] bi' ničamXana'

 TEN ON-IT FIVE IT-PAST MY-THOUGHT

 Conj[ha] Num[pa:bahi'].

 OR SIX

 'He was fifteen [years old], I think, or sixteen.'

A reason for introducing all 'or'-type coordinate structures at this point is that the agreement patterns remain unaffected by the transformation which deletes structure when combining the two (or more) disjunctively coordinated elements in the same Sentence; that is, singular Nominal 'or' singular Nominal has singular agreement patterns, while singular Nominal 'and' singular Nominal has plural

agreement patterns. Compare the following examples:

- (1.1c) mia t čičint ha na:št.

 MAY DUB(-sg) BOY OR GIRL

 'Maybe it's a boy or a girl.'
- (1.1d) 'ay±' 'ami' 'ana' k^w±n± q±i, ...

 HIS-MOTHER AND HIS-FATHER QUOT-PLURAL SAY

 'His mother and his father (they) said, ...'

Thus, coordinated structures with 'or' can be accounted for by simple deletion, while other coordinated constructions have quite different properties.

1.2.
$$S \rightarrow ([Adv]*) NomP^PredP^Aux$$
 (< 1.1)

Adv = Sentence adverbial (1.7)

NomP = Nominal-Phrase (1.16)

PredP = Predicate-Phrase (1.5)

Aux = Auxiliary (1.3)

1.2.1. PS rule 1.2 is somewhat unusual in that the Auxiliary is described as immediately dominated by Sentence.

However, there seems to be no compelling reason to treat the Serrano Auxiliary as a Predicate-Phrase constituent,

as is usually done for Auxiliaries in transformational grammar. This usual treatment of Aux, as a PredP constituent, has not, to my knowledge, been justified, except, possibly, on (syntactically irrelevant) morphophonemic grounds, that is, the fact that in most languages the Auxiliary material is phonologically attached to the Verb. The present treatment of the Auxiliary is not altogether novel. For a similar treatment of the English Auxiliary, see Fillmore (1966:7).

- 1.2.2.0. The following examples illustrate the various combinations of S material. As will be done in all instances of rules involving [...]*, only a sample is given to indicate the possibility that a category may be repeated indefinitely.
- 1.2.2.1. S[NomP^PredP^Aux]:
- (1.2a) NomP[wahi'] Aux[kWinibi'], PredP[payika'

 COYOTE QUOTATIVE-HE-PAST ALONG

 po:qp nim].

ON-THE-ROAD WALK

'The Coyote was walking along the road,'

- 1.2.2.2. S[Adv^NomP^PredP^Aux]:
- (1.2b) Adv['a:p] NomP[ma:rina'iam] Aux[kwini]

 THERE MORONGOS QUOTATIVE-PLURAL

 PredP[ni:pq].

 SETTLE

 'There the Morongos settled.'
- 1.2.2.3. S[Adv^Adv^Adv^NomP^PredP^Aux]:
- (1.2c) Adv['ubiht] Adv[mutu' nikwaqpa'], Adv[ni-LONG-AGO STILL IN-MY-YOUTH MY-nančui'b 'amim'kibii], PredP[hakwup] Aux[LATE-FATHER WHEN-HE-DIED VERY Čimi'] PredP(continued)[hohou:nan].

 WE-PAST BE-POOR
 'Long ago, when I was still young, when my father died, we were very poor.'
- In (1.2c) the NomP is represented only by [čimi-], which has been incorporated into the Auxiliary.
- 1.2.3. The NomP that is immediately dominated by S is defined as "subject." The PredP is some sort of comment about the subject. Because PredP dominates some NomP's,

it will be developed before NomP.

1.3. Aux
$$\rightarrow$$
 Asp^EvP (< 1.2)

Asp = Aspect (2.5)

EvP = Evidential-Phrase (1.4)

In most cases Aspect is phonologically zero, the "un-marked" form, as in (1.3a).

(1.3a) pay±ka' EvP[k^W±n] p±nqçu' Asp[Ø].

AWAY QUOTATIVE PASS-MOTION UNMARKED

'It passed by way off.'

There are lexical reasons for considering the unmarked form as a member of the category Aspect; see section 2.5.

If there is overt Aspect material, and no Verb (1.12) is present in the Predicate (1.5), the empty Verb #ñiha:# 'do' is introduced transformationally for the Aspect marker to be attached to, as in (1.3b) where the Predicate is a Nominal-Phrase, and (1.3c) where the Predicate is an Adjective-Phrase.

- (1.3b) EvP[tan] hou:nanič ñi- Asp[-:b].

 DUBITATIVE-I POOR-ONE DO FUTURE

 'I'll be poor.'
- (1.3c) hača:'i m ñia:- Asp[-qam].

 SHARP THEY DO GOING-TO-PLURAL

 'They're going to be sharp.'
- 1.4. EVP \rightarrow (EV) (#ta#) EV (Past) (?) (< 1.3)

Ev = Evidential (2.6)
#ta# = Dubitative Evidential (Dub)(2.6)
Past = Past tense (1.4.4)
? = Question (Ques)(1.4.5)

- 1.4.1. The Evidential-Phrase bears the subject-object agreement marker and, except for 2, is transformationally reordered to occur early in the Sentence.
- 1.4.2. Evidentials specify the validity of the statement. Each Sentence must include at least one Evidential, or up to three Evidentials. There are lexical restrictions (2.6) concerning which Evidential can appear where in the string of Evidentials.

- 1.4.3. The zero-form is the "Direct" Evidential. The Direct is used only in the case of reporting first-hand know-ledge, that is, the speaker identifies himself as a witness, as in (1.4a), or in the simple (= Direct) Imperative (2.5), as in (1.4b).
- (1.4a) 'i:p Ev[Ø] bi' wahi' pinq.
 HERE (DIRECT) HE-PAST COYOTE PASS
 'The Coyote passed here (I saw him).'
- (1,4b) ŋirirq Ev[Ø] ç.

 MOVE (DIRECT) YOU
 'Move!'
- 1.4.4. Past is analyzed as an optional part of the expansion of EvP. This is to say, Past is not opposed to any 'present' tense, but merely to its own absence. Sentences lacking Past tense are, for convenience, referred to as "non-past," but this should be understood as having no positive morphemic reference.

When there is enough information already present in the context such that 'past' meaning is understood, the choice to include <u>Past</u> seems to be completely optional (as is the case in some narrative styles in English). Some examples of Sentences with 'past' meaning but no <u>Past</u> (ex-

cept for the first Sentence-fragment) are found in (1.4c), a fragment of a text having to do with a recollected experience.

...yang 'ama' bi' 'akalesa'p mi waha'. (1.4c)HE-PAST IN-HIS-BUGGY GO ALSO BUT HE čatihpinu' kim. "hwa:n ramo;n" qii m BEHIND-US COME Juan Ramón SAY THEY HIS-NAMEmimi', mi, 'a:p. 'ubia & ACC LONG-AGO DIE-PERF GO THERE ALREADY WE THEqai:či h^wą:čq tuk^wuh^wpaka', k^wut pinq ACC HILL-ACC CLIMB UPWARD TRAIN PASS ti:buka'. 'ibi' 'ubia houkwp yu:'. houkwp yu:' DOWNWARD THIS ALREADY ONE CRY ONE CRY ta:miat.

CLOCK

'...but he went in his own buggy too. He comes behind us. They call him "Juan Ramón." (He died a long time ago.) He goes there. We're climbing up the hills already. A train passes on its way down. This [clock] strikes one already. The clock strikes one. ...'

1.4.5.1. Whether or not a Sentence is a Question (Ques) is treated here as a function of the Auxiliary. ? represents rising pitch, which normally occurs on the last syllable of

the Verb stem or of any Auxiliary material postposed to the Verb stem. This is symbolized by placing the ? after the syllable with the rising pitch. Examples are:

- (1.4d) Ev[kwi'] n kwa'a?

 POTENTIAL I EAT QUESTION
 'Could I eat it?'
- (1.4e) na: St Ev[ta-] -bi' hihi? CiCinti.

 GIRL DUBITATIVE SHE-PAST SEE QUES BOY-ACCUSATIVE
 'Did the girl see the boy?'
- (1.4f) ti\(\frac{1}{4}\)ha- Asp[-qa-] -i Ev[ta-]-n?

 TELL GOING-TO ACC DUBITATIVE I QUESTION

 'Am I going to tell him?'
- (1.4g) k^wa'i Ev[ta-] -m ç ? kih^wu:çi.

 EAT DUBITATIVE PL YOU QUESTION FISH-ACCUSATIVE
 'Are you (pl) eating fish?'
- 1.4.5.2. With a question word, that is, a form beginning with #ha#, the Indeterminate Determiner (2.2), present in the Sentence, ? is transformationally deleted, the presence of #ta#, the Dubitative Evidential (2.6), alone marking the construction as a Question. An example is:

- (1.4h) hai:ŋk^wa' Ev[ta-] -b±' mi.

 TO-WHERE DUBITATIVE HE-PAST GO
 'Where did he go?'
- 1.4.5.3. In Questions with no Verb and no question word, the rise in pitch occurs in various places, as in the following examples:
- (1.4i) 'i:p Ev[ta-] -b±' ?

 HERE DUBITATIVE IT-PAST QUESTION
 'Was it here?'
- (1.4j) Ev[qai] Ev[t] 'a'ayi 'i:p? 'imiyka'.

 NOT DUBITATIVE GOOD HERE QUES TO-YOU

 'Isn't it good here for you?'
- 1.4.6.0. The following examples illustrate the various combinations of EvP material.
- 1.4.6.1. EvP[Ev]:
- (1.4k) 'i:p Ev[t] wahi' pinkib.

 HERE DUBITATIVE COYOTE PASS-FUTURE

 'The Coyote will pass here.'

- 1.4.6.2. EvP[Ev^?]: see (1.4d).
- 1.4.6.3. EvP[#ta#^Ev]:
- (1.41) 'ama' t Ev[X] ma:mç.

 HE DUBITATIVE INFERENTIAL HEAR
 'He must hear it (i.e., it must be that he hears
 it).'
- 1.4.6.4. EvP[#ta#^Ev^?]: No example; see 2.6.1.
- 1.4.6.5. EvP[Ev^Ev]:
- (1.4m) Ev[qai] Ev[k^win] hamin qii.

 NOT QUOTATIVE HOW SAY

 'He didn't say anything.'
- 1.4.6.6. EvP[Ev^Ev^?]: see (1.4j).
- 1.4.6.7. EvP[Ev^#ta#^Ev]:
- (1.4n) a:m Ev[mai] t Ev[$k^W \pm n \pm$] $q^W \circ i'b$.

 THEY MAY DUBITATIVE QUOTATIVE-THEY DIE-FUTURE
 'They might die.'
- 1.4.6.8. EvP[Ev^\pmathrm{Ev^?}]: No example; see 2.6.1.

- 1.4.6.9. EvP[Ev^Past]:
- (1.40) 'i:p Ev[k^wini-] -bi' wahi' pinq.

 HERE QUOTATIVE HE-PAST COYOTE PASS

 'The Coyote passed here (so I am told).'
- 1.4.6.10. EvP[Ev^Past^?]: see (1.4e), (1.4h), (1.4i).
- 1.4.6.11. EvP[#ta#^Ev^Past]:
- (1.4p) t Ev[Xa-] -b±' ma:mq.

 DUBITATIVE INFERENTIAL HE-PAST HEAR

 'He must have heard it.'
- 1.4.6.12. EvP[Ev^#ta#^Ev^?]: No example; see 2.6.1.
- 1.4.6.13. EvP[Ev^Ev^Past]:
- (1.4q) Ev[qai] Ev[$k^W \pm n \pm -$] -m±' hai:m i:p qaç NOT QUOTATIVE THEY-PAST WHO HERE DWELL ta:qtam.

PEOPLE

'No people lived here,'

- 1.4.6.14. EvP[Ev^Ev^Past^?]:
- (1.4r) Ev[qai] Ev[ta-] -bi' mi: ?

 NOT DUBITATIVE HE-PAST GO QUESTION

 'Didn't he go?'
- 1,4,6,15. EvP[Ev^\(\frac{\pmat}{\pmat}\) Ev^\(\frac{Past}{\pmat}\)]:
- (1.4s) 'ačam Ev[qai] t Ev[Xa-] čimi'

 WE NOT DUBITATIVE INFERENTIAL WE-PAST

 wi:habi'q.

 INCREASE-RESULT

 'We must not have increased.'
- 1.4.6.16. EvP[Ev^\(\frac{\pmatar}{2}\) example; see 2.6.1.
- 1.5. PredP \rightarrow Pred ([(Conj) Pred]*) (< 1.2)

Pred = Predicate (1.6)
Conj = Conjunction (2.8)

1.5.0. Within any Predicate-Phrase any number (≥ 1) of
Predicates may occur. They may or may not be separated by
Conjunctions.

- 1.5.1. An example of a Sentence containing several Predicates not separated by Conjunctions is:
- (1.5a) kwinibi' 'awočahab Pred[mi], Pred[tum
 QUOT-HE-PAST HER-HUSBAND GO SOME
 hai:p'i:p nim], Pred[pi:ra:kwi na:n].
 WHERE HERE WALK THEIR-FOOD-ACC LOOK-FOR
 'Her husband went walking around somewhere looking
 for food for them.'
- 1.5.2. An example of a Sentence containing a pair of Predicates separated by a Conjunction is:
- (1.5b) ni:ht kwinibi' Pred[kwuça:ti 'u:']

 WOMAN QUOT-SHE-PAST STICK-ACC TAKE

 Conj['ani] Pred['ani:pkihwa'p tabii].

 AND ON-HER-CHAIR PLACE

 'The woman took a stick and placed it on her chair.'
- 1.5.3. It should be noted that PS rule 1.5 provides a source for Sentences like (1.5c), involving the repetition of identical Predicates. Chomsky leaves this sort of phenomenon as a marginal unexplainable residue (1965:225). The present treatment is that such Sentences simply involve

a number of Predicates which happen incidentally to have identical internal structure.

NomP
NumP

1.6. Pred →

1.8. TS
$$\rightarrow$$
 ($\left\{\begin{array}{c} NomP \left(\underline{y}\underline{\partial} \#\right) \\ NumP \\ \#S\# \end{array}\right\}$) Adv_{TS} (< 1.6, 1.7)

NomP = Nominal-Phrase (1,16)

ya# Accusative case (Acc)

NumP = Numeral-Phrase (1.19)

 $Adv_{TS} = Adverb of time-space (2.12)$

1.8.1. In the present description, instead of having separate adverbials of Time, Location, Direction, and so forth, a generalized "Time-Space" adverbial is recognized as being able to serve these different functions depending on the nature of its constituent parts.

Consider (1.8a) and (1.8b):

(1.8a) N[to:
$$\mathfrak{ga}$$
-] Adv $_{TS}$ [-ba'] 'in the summer' SUMMER LOCATION

These are identical in their internal structure except for the particular Nouns involved, yet (1.8a) could be said to function as a time adverbial while (1.8b) functions as a location adverbial, the differences in function reflecting no more than the difference in meaning between [to:na-] 'summer' and [qai:-] 'hill'.

- 1.8.2.0. The following examples illustrate the various combinations of Time-Space adverbial material.
- 1.8.2.1. $TS[Adv_{TS}]$:
- (1.8c) $n^{\frac{1}{2}}$ ' Adv_{TS} ['ahk | mana'qçu'. I-PAST HERE RETURN-MOTION 'I came home here.'
- 1.8.2.2. TS[NomP^Adv_TS]:
- (1.8d) k^{W} in NomP[mi:naht 'aki:-] Adv_{TS} [-b] QUOT GOPHER'S HER-HOUSE LOCATION piču:çu'.

ARRIVE-MOTION

'He arrived at the Gopher's house.'

1.8.2.3. TS[NomP^<u>yə#</u>^Adv_{TS}]:

- (1.8e) taminiç ma:hwa'nib NomP[ki:č-] -i

 DUB-YOU-PL-ME BURN-FUTURE HOUSE ACC

 Adv_{TS}[pimia'].

 TOGETHER-WITH-IT
 - 'You'll burn me together with the house.'
- 1.8.2.4. TS[NumP^Adv $_{TS}$]:
- (1.8f) NumP[pa:hi'-] Adv_{TS}[-ka'] ni' ti:'wim.

 THREE DIRECTION I-PAST COUNT

 'I counted to three.'
- 1.8.2.5. TS[#S#^Adv_{TS}]:
- (1.8g) S['ibi' ti‡baç 'ubiht mutu' nama:'i ñia:-]

 THIS EARTH LONG-AGO STILL SOFT DO

 Adv_TS[-w] k^w±n±m±' qaç woh^w.

 WHEN QUOT-THEY-PAST BE TWO

 'When this earth was still soft long ago, there were two.'
- 1.8.3. Unlike (1.8g), however, most embedded Sentences in TS adverbials are based on nominalizations, as in the following example.

(1.8h) t Xabi' puyu 'ayai', 'i:m'qçu' 'añu puahqa'

DUB INF-IT-PAST ALL THEN END-MOTION HIS MONEY

NomP[S[toqq^wpi'-]] Adv_{TS}[-biu'] Nom[S[

GAMBLING FROM

(continued) 'amač točint piyika']].

THAT-GEN YOUTH'S TO-HIM

'All of his money, then, must have come to an end from gambling with that young man.'

1.9. Manner
$$\rightarrow \left(\left\{ \begin{array}{c} NomP \\ AdjP \\ [\#S\#]* \end{array} \right\} \right) Adv_{manner}$$
 (< 1.6)

NomP = Nominal-Phrase (1.16)
AdjP = Adjective-Phrase (1.13)
Adv_{manner} = Adverb of manner (2.13)

- 1.9.0. The following examples illustrate the various combinations of Manner adverbial material.
- 1.9.1. Manner[Adv manner]:
- (1.9a) hawei't ni Adv_{manner}['ina:c] qac 'isk^wela'p.

 ALWAYS I-PAST BE AT-SCHOOL

 'I got along nicely all the time at school.'

- 1,9.2. Manner[NomP^Adv manner]:
- (1.9b) NomP['a:ča'-] Adv_{manner}[-n] tan w±k‡bib.

 AXE INSTRUMENTAL DUB-I HIT-FUTURE

 'I'll hit it with the axe.'
- 1.9.3. Manner[AdvP^Adv_{manner}]:
- (1.9c) 'amai' AdjP[hwuwa:'i-] Advmanner[-ka-] -m

 NOW DIFFERENT -LY THEY

 iču'kin.

 MAKE
 'Now they do things differently.'
- 1.9.4. Manner[#S#^Advmanner]:
- (1,9d) kwin S[tuka-] Advmanner[-nq] pičii a:p.

 QUOT PACK SO-DOING ARRIVE THERE

 'He arrived there carrying it on his back.'
- 1.10. VblP \rightarrow (BenP) VP^Aux_V (< 1.6)

 BenP = Benefactive-Phrase (1.15)

 VP = Verb-Phrase (1.12)

 Aux_V = Verbal Auxiliary (1.11)

- 1.10.0. The following examples illustrate the various combinations of Verbal-Phrase material,
- 1.10.1. VblP[VP^Aux_V]:
- (1.10a) VP[mana'q-] Aux_V[-qu'ai] ȱm±'.

 RETURN MOTION-ACCUSATIVE WE-PAST

 'We went home.'
- 1.10.2. VblP[BenP^VP^Aux,]:
- (1.10b) hawei't k^wini VP[pa:çi 'iča:-] Aux_V[-çu'],

 ALWAYS QUOT-THEY WATER-ACC DIP MOTION

 BenP[ta:qtam pimika'].

 PEOPLE FOR-THEM

 'They always went to dip water for the people.'
- 1.11. Aux_V \rightarrow (Freq) (<u>cu'a#</u>) <u>yə#</u> (< 1.10)

Freq = Frequentative (2.14)

<u>cu'a#</u> Motion suffix (Mot) (1.11.2)

yə# Accusative case (Acc) (1.11.1)

1.11.1. In addition to its appearing after the other ${\rm Aux}_{\rm V}$ material, as in (1.10a), Accusative case is transformationally distributed among the Nominal-Phrases which are imme-

diately dominated by constituents of VblP, that is, among the direct object (1.12.1), indirect object (1.12.1), and benefactive object (1.15.1), as in the following examples.

- (1.11a) qai k^win ham-i hi:t-i maqa-i.

 NOT QUOT WHO-ACC WHAT-ACC GIVE-ACC

 'She didn't give anybody anything.'
- (1.11b) 'imi-yi-n mi:sk-čuna-qa'.

 YOU-ACC-I WET-BENEFACTIVE-GOING-TO
 'I'm going to wet it for you.'

In various phonological and morphological contexts, Accusative case is deleted in different patterns. One of these patterns demonstrates the close relationship of the verbal and nominal suffixes. This is the Direct (1.4.2) Imperative, where Accusative case is transformationally deleted such that it does not appear in either its post-nominal or post-verbal position, as in (1.11c). This pattern seems to

(1.11c) pa:ç či''ič-ičun.

WATER YOU-ME DIP-BENEFACTIVE

'Dip water for me!'

be the strongest evidence available for the present analysis whereby the [-i] which occurs after verbal material and

that which occurs after nominal material are treated as different occurrences of the same underlying element.

- 1.11.2.1. <u>cu'a#</u>, the Motion suffix, implies that motion is involved in some way with the action denoted by the Verb, either directly, as in (1.11d), or metaphorically, as in (1.11e).
- (1.11d) hi: n-cu'a-i kwini wiciham.

 HUNT-MOTION-ACC QUOT-THEY MEN

 'The men went hunting.'
- (1.11e) po:qt 'i:m'q-qu' pa:q 'ahi:bib.

 ROAD END-MOTION WATER'S AT-ITS-EDGE

 'The road comes to an end at the water.'
- 1.11.2.2. The meaning of <u>cu'a#</u> with Verbs whose definition already involves motion is more difficult to identify. It may mean simply that the focus is more on the motion involved than it would be otherwise. An example is (1.10a).
- 1.11.3.0. The following examples illustrate the various combinations of ${\rm Aux}_{\rm V}$ material, other than ${\rm Aux}_{\rm V}[$ $\underline{{\rm y}}$ $\underline{{\rm y}}$ $\underline{{\rm y}}$ $\underline{{\rm w}}$ $\underline{{\rm v}}$, as in (1.11a), and ${\rm Aux}_{\rm V}[$ $\underline{{\rm cu'a}}$ $\underline{{\rm v}}$ $\underline{{\rm w}}$ $\underline{{\rm v}}$ $\underline{{\rm w}}$ $\underline{{\rm v}}$ $\underline{{\rm v}$ $\underline{{\rm v}}$ $\underline{{\rm v}}$ $\underline{{\rm v}}$ $\underline{{\rm v}$ $\underline{{\rm v}}$ $\underline{{\rm v}$ $\underline{{\rm v}}$ $\underline{{\rm v}}$ $\underline{{\rm v}}$ $\underline{{\rm v}}$

- 1.11.3.1. $Aux_V[Freq^y=\#]$:
- (1.11f) timi- Freq[-m-] -ina- -i n.

 SHUT ITERATIVE CAUSATIVE ACCUSATIVE I

 'I keep shutting it.'
- 1.11.3.2. Aux_V[Freq<u>cu'a#^yə#</u>]:
- (1.11g) Freq[man'-] -man'q-çu'a- -i m.

 DISTRIBUTIVE RETURN-MOTION ACCUSATIVE THEY

 'They went home (each to his respective home).'

1.12. VP
$$\rightarrow$$
 ($\left\{\begin{array}{c} \text{(NomP)} \left\{\begin{array}{c} \text{NomP} \\ \text{N} \\ \text{AdjP} \end{array}\right\}\right\}$) V (PunctP) (< 1.10)

NomP = Nominal-Phrase (1.16)
N = Noun (2.1)
V = Verb (2.15)
AdjP = Adjective-Phrase (1.13)
PunctP = Punctual-Phrase (1.14)

1.12.1. A Nominal-Phrase immediately dominated by VP is defined as an "object." If there are two NomP's immediately dominated by the same VP node, the NomP immediately to the left of the Verb is the "direct object," that to the

left of the direct object is the "indirect object." Verbs that cooccur with objects are referred to as "transitive." Verbs that take one object are sometimes referred to as "simple transitive" and those that take both a direct and an indirect object as "double transitive." Verbs that take no object are "intransitive."

- 1.12.2. Verbs that appear in the environment __PunctP are referred to as "Q-class" Verbs, this label having reference to the morphophonemic shape of the Punctual suffix (1.14), which is go#. Most Q-class Verbs are intransitive.
- 1.12.3.0. The following examples illustrate the various combinations of Verb-Phrase material.
- 1.12.3.1. VP[V]:
- (1.12a) nana:m kwinimi' V[mi].

 YOUNG-WOMEN QUOT-THEY-PAST GO

 'Some young women went.'

 DUB INF-I-PAST ENTER PUNCTUAL TO-THERE

 'I must have gone in there.'
- 1.12.3.10. VP[NomP^V^PunctP]:
- (1.12i) NomP[ama-] -i & NomP(continued)[qai:&-] -i

 THAT ACC WE HILL ACC

 hwa* V[-hwa*] PunctP[-q].

 DISTR CLIMB PUNCTUAL

 'We climbed those hills.'

- 1.12.3.11. VP[NomP^NomP^V^PunctP]: No example; see 2.15.1.
- 1.12.3.12. VP[N^V^PunctP]: No example; see 2.1.1, 2.15.1.
- 1.12.3.13. VP[NomP^N^V^PunctP]: No example; see 2.1.1,
 2.15.1.
- 1.12.3.14. VP[AdjP^V^PunctP]:
- (1.12j) AdjP[p‡çi-] V[-hab-] PunctP[-q] ni:yka'.

 HEAVY INCREASE PUNCTUAL TO-ME

 'It's getting heavy for me.'
- 1.12.3.15. VP[NomP^AdjP^V^PunctP]: No example; see 2.15.1.
- 1.12.3.16. VP[#S#^V^PunctP]: No example; see 2.15.1.
- 1.13. AdjP \rightarrow ($\left\{\begin{array}{c} N \\ V \text{ (PunctP)} \end{array}\right\}$) Adj (< 1.6, 1.9, 1.12)

N = Noun (2.1)

V = Verb (2.15)

PunctP = Punctual-Phrase (1.14)

Adj = Adjective (2.16)

- 1.13.0. The following examples illustrate the various combinations of Adjective-Phrase material.
- 1,13.1. AdjP[Adj]:
- (1.13a) k^wa'i'a:ç n\(\frac{1}{2}\):yka' hak^wup Adj[\(\frac{1}{2}\): bu'].

 FOOD TO-ME VERY BITTER

 'The food [tastes] very bitter to me.'
- 1.13.2. AdjP[N^Adj]:
- (1.13b) ni: 'n amač pihpa' N[mita-] Adj[-: 'i].

 I HIS ON-HIM TALL-ONE (ADJECTIVALIZER)

 'I'm taller than he is.'
- 1.13.3. AdjP[V^Adj]:
- (1.13c) V[hača-] Adj[-: 'i] ñia:qa'.

 BECOME-SHARP (ADJECTIVALIZER) GOING-TO-DO

 'It's going to be sharp.'
- 1.13.4. AdjP[V^PunctP^Adj]:

1.14. PunctP \rightarrow (\pm ' \pm #) $q \ni \#$ (< 1.12, 1.13)

<u>±'±#</u> Resultative suffix (Result) (1.14.2)
go# Punctual suffix (Punct) (1.14.3)

- 1.14.1. It is necessary to recognize that (<u>i'i#</u>) <u>qo#</u> behaves as a unit for the application of the phonological rules: a metathesis takes place in Verbs appearing in the environment __PunctP. Compare the transitive Verb #qa+tu'a# 'break, cut transversely', as in (1.14a), with
- (1,14a) qatua'qai n.

 CUT-GOING-TO-ACC I

 'I'm going to cut it.'

the related Q-class Verb $\frac{\#qa+tu\#}{\#qa+tu\#}$, which appears before $\frac{qa\#}{(>[-k-])}$ in (1.14b), and before $\frac{i'i\#^qa\#}{qa\#}$ (> [-u'q]) in (1.14c) ([q^w out] < qau+t < metathesis of qa+tu).

- (1.14b) V[qwout-] PunctP[-k-] -ib t.

 GET-CUT PUNCTUAL FUTURE DUBITATIVE

 'It'll get cut.'
- (1.14c) 'ubia V[qWout-] PunctP[-u'q].

 ALREADY GET-CUT RESULTATIVE-PUNCTUAL

 'It's already cut.'
- 1.14.2. The Resultative suffix $\frac{\pm \cdot \pm \#}{\pm \cdot \pm \#}$ indicates that the subject of the Sentence is in a condition or posture as a result of the action indicated by the Verb. Examples, with non-resultative forms for comparison, are:
- (1.14d) ##naq#i'i#qə## [ŋaqi'q.] 'It is perched.'
 cp. ##naq#qə## [ŋaqq.] 'It perches.'
- (1.14e) ##pu:+t#i'i#qa## [pu:tu'q.] 'It is full.'

 cp. ##pu:+t#qa## [pu:tq.] 'It becomes full.'
- 1.14.3. The suffix go#, in the absence of the Resultative suffix i'i#, seems to indicate "punctual" or momentaneous action, that is, action begun and terminated in an instant. To be consistent, the tag "Punctual" (Punct) is used for this suffix in all contexts.

1.15. BenP \rightarrow NomP^Ben (Ben) (< 1.10)

NomP = Nominal-Phrase (1.16)

Ben = Benefactive (2.10)

- 1.15.1. A Benefactive-Phrase consists of a Nominal-Phrase and either the Directional suffix yəqā# or the Benefactive suffix ičuna# or both. The Benefactives are lexically specified such that only one instance of each Benefactive can occur within any Benefactive-Phrase (2.10.2). The Benefactive suffix, ičuna#, is transformationally reordered to appear after the Verb-Phrase (3.1.4). The Nominal-Phrase immediately dominated by BenP is the "benefactive object."
- 1.15.2.0. The following examples illustrate the different sorts of Benefactive-Phrases.
- 1.15.2.1. BenP[NomP^Ben]:
- (1.15a) 'a:m tamiči' NomP['ačami-]

 THEY DUBITATIVE-THEY-US US

- 1.17.0. The following examples illustrate the various combinations of Nominal material.
- 1.17.1. Nom[NP]:
- (1.17a) 'ubiht mi' qaç NP[yua:qaiam] 'i:p.

 LONG-AGO THEY-PAST BE CHEMEHUEVIS HERE

 'There used to be Chemehuevis here.'
 - 1.17.2. Nom[DP^NP]:
 - (1.17b) 'ibi' DP['ama'] NP[nipulin].

 THIS THAT MY-DAUGHTER

 'This is that daughter of mine.'
 - 1.17.3. Nom[Intens^NP]:

- (1.17c) Intens[hak up] NP[ni:htabɨç].

 VERY OLD-WOMAN

 'She's a very old woman.'
- 1.17.4. Nom[Intens^DP^NP]:
- (1.17d) 'ayai' kwin ama' ti:t 'i:m'kin Intens[puyu]

 THEN QUOT THAT DEVIL FINISH ALL

 DP[ama-] -i NP[hwukaht-] -i.

 THAT ACC DEER ACCUSATIVE

 'Then that devil finished all of the deer.'
- 1.17.5. Nom[#S#]:
- (1.17e) S[točiñam yua:qaiami-] -m mi qai:yka'.

 YOUTHS CHEMEHUEVIS THEY GO TO-THE-HILLS
 'Chemehuevi youths went into the hills.'
- 1.18. NP \rightarrow (NomP) (#S#) N (< 1.17)

NomP = Nominal-Phrase (1.16) N = Noun (2.1)

1.18.1. Any word (defined morphophonemically) which contains a Noun introduced by PS rule 1.18 is referred to as

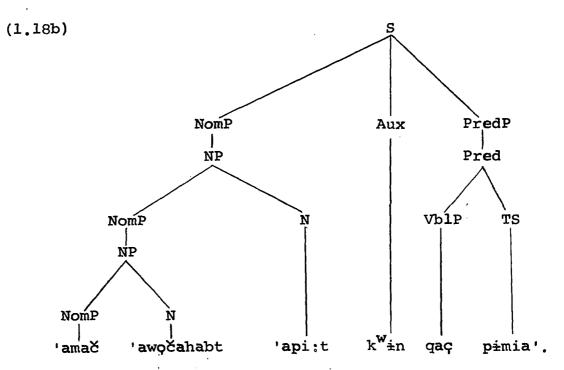

a "Noun stem." Further, the Noun introduced by the present phrase-structure rule is the "head" of the Nominal-Phrase which dominates it.

- 1.18.2. PS rule 1.18 introduces the possessor Nominal-Phrase, such that there is possible a left-branching possessive construction of indefinite depth. This is necessary in Serrano because of the nature of the strict subcategorization of Nouns (such that many Nouns are positively specified for the contextual feature [NomP..._]) and also because of the fact that there exists no Sentencetype to which the possessive construction can be related. For example, [niqwo:r] 'my older sister' cannot be related to some underlying Sentence of, say, the sort 'I have an older sister' (as Lees (1960:133) suggests can be done for similar constructions in English). The nearest Serrano equivalent to "I have an older sister" would be
- (1.18a) n±q^Wq:r qaç.

 MY-OLDER-SISTER BE

 'My older sister exists.'

in which $[n \pm q^W q:r]$ is simply the subject Nominal-Phrase. An example of a Sentence with a possessive construction within a possessive construction is:

HER HER-HUSBAND'S HIS-YOUNGER- QUOT DWELL WITH-HER -SISTER
'Her husband's younger sister stayed with her.'

1.18.3.0. The following examples illustrate the combinations of Noun-Phrase material other than NP[NomP^N], as in (1.18b), and NP[N]. For examples of NP[N], see (1.17a, c, d).

1.18.3.1. NP[#S#^N]:

(1.18c) 'amai' po:qt wi:sei't 'i:p 'ama' S[payika' mi-]

NOW ROAD WIDE-ONE HERE THE AWAY GO
N[-:'aç] S(continued)[ma:rai'ka'].

-ER TO-TWENTYNINE-PALMS

'Now, the road is wide here, the one that goes off to Twentynine Palms.'

1.18.3.2. NP[NomP^#S#^N]:

A note regarding (1.18d): in Serrano, forgetting is an action attributed to one's heart.

1.19. NumP
$$\rightarrow$$
 ($\left\{\begin{array}{c}D\\PreNum\end{array}\right\}$) Num (< 1.6, 1.8, 1.20)

D = Determiner (2.2)

PreNum = Pre-Numeral (1.20)

Num = Numeral (2.9)

1.19.1. The only Determiner that is lexically permitted (2.2.3) to precede any Numeral is the Indeterminate Determiner #ha# 'wh-', and the only Numeral that can follow #ha# is the indefinite Numeral iniki# (2.9.3), which has been found only in this combination, as in (1.19a).

(1.19a) D[h-] Num[-iñiki'] t hipiyam pi

HOW-MANY DUB CHILDREN YOU-THEM
ya:nim.

'How many children do you have?'

- 1.19.2.0. The following examples illustrate the other combinations of NumP material.
- 1.19.2.1. NumP[Num]:

HAVE

- (1.19b) n±:'n Num[wačah] h±y±yam ya:n±m.

 I I FOUR CHILDREN HAVE

 'I have four children.'
- 1,19.2.2. NumP[PreNum^Num]:
- (1.19c) ...ani ni' mamai:ha' nimai:ham wiwiham

 AND I-PAST BEAR-CHILDREN MY-CHILDREN SEVERAL

 PreNum[wahmac pihpa'] Num[wohw].

 TEN ON-IT TWO

 '...and I had my twelve children.'

1.20. PreNum
$$\rightarrow$$
 NumP^Adv_{TS} (< 1.19)

NumP = Numeral-Phrase (1.19)

$$Adv_{mg}$$
 = Adverb of time-space (2.12)

No Numeral-Phrase more complex than (1.20a) was elic-

ited, but it seems unreasonable to suppose that there are any grammatical constraints preventing the generation of an indefinitely recursive Numeral construction. 1.21. DP \rightarrow (PreD)(D) D (< 1.17)

PreD = Pre-Determiner (2.3)
D = Determiner (2.2)

- 1.21.0. The following examples illustrate the different combinations of Determiner-Phrase material.
- 1.21.1. DP[D]:
- (1.21a) D['i:m] ma:rina'iam k^{W} inimi' kim, THESE MORONGOS QUOT-THEY-PAST COME k^{W} i:mqnu'.

FROM-THE-NORTH

'These Morongos came from the north.'

- 1.21.2. DP[D^D]:
- (1.21b) k^wini piču;çu' D[hai:-] -p D['i:-]

 QUOT-THEY ARRIVE WHAT LOCATION THIS
 -p qai:b.

LOCATION IN-THE-MOUNTAINS

'They arrived somewhere in the mountains.'

1.21.3. DP[PreD^D]:

- (1.21c) ni:' n PreD[t] D[Xi:t-] -i ma:mq.

 I I DUB SOMETHING ACC HEAR
 'I hear something.'
- 1.21.4. DP[PreD^D^D]:
- (1.21d) 'ama' kwin pi:na' PreD[tum] D[hai:-]

 THAT QUOT THEIR-FATHER SOME WHAT

 -p D['i:-] -p nim.

 LOCATION THIS LOCATION WALK

 'That father of theirs was gone off somewhere.'

2. LEXICAL RULES

2.0. In this section are given the rules whereby lexical categories are mapped into Complex Symbols (CS), subcategorization rules, and sample lexical entries.

A lexical entry is of the form (D,C), where D is a distinctive feature matrix and C is a complex symbol,

the latter being a set of features of various sorts (syntactic and semantic features, features that specify which morphological or transformational processes apply to strings containing the items in question, features that exempt items from certain phonological rules, and so on). (Chomsky 1965:164)

In practice here, the phonological portion of the lexical entry is spelled out in alphabetic morphophonemic symbols and the semantic features are merely hinted at by an English gloss.

The specification of syntactic features involves the careful distinction between strict subcategorization rules and selectional rules.

Rules...which analyze a symbol in terms of its categorial context, I shall henceforth call strict subcategorization rules. Rules...which analyze a symbol (generally a complex symbol) in terms of syntactic features of the frames in which it appears, I shall call selectional rules. The

latter express what are usually called "selectional restrictions" or "restrictions of cooccurrence." (Chomsky 1965:95; Chomsky's emphasis)

The specification of syntactic features is done in accordance with the following conventions:

- (2.0a) (i) only positively specified strict subcategorization features and only negatively specified selectional features appear explicitly in lexical entries, the others being introduced by the auxiliary convention (ii) (Chomsky 1965:164)
 - (ii) if the lexical entry (D,C) is not provided with the feature specification $[\alpha \phi_{\psi}]$ for the contextual feature $[\phi_{\psi}]$ (where $\alpha = +$ in the case of a strict subcategorization feature and $\alpha = -$ in the case of a selectional feature), then assign it the specified feature $[-\alpha \phi_{\psi}]$ (Chomsky 1965:165)
- (2.0b) ...a base rule that analyzes the lexical category
 A into a complex symbol automatically includes the
 feature [+A] as one of the elements of this complex
 symbol...[and] each lexical entry automatically, by
 convention, contains the feature [-A] for every
 lexical category A, unless it is explicitly provided with the feature [+A]. (Chomsky 1965:110111)

- (2.0c) suppose that $([\alpha_1F_1], \ldots, [\alpha_nF_n])$ is a maximal hierarchic sequence with respect to the grammar G, and that (D,C) is a lexical entry of G, where C contains $[\alpha_nF_n]$. Then C is extended automatically to C' containing C along with all of the specified features $[\alpha_iF_i]$, for each i, $1 \le i < n$. (Chomsky 1965:165-166)
- (2.0d) Let us say that the feature $[\alpha F]$ is <u>lexically determined</u> in the grammar G if there is a hierarchic sequence ([+K],..., $[\alpha F]$) with respect to G, where K is a lexical category ($\alpha = +$ or -). This is to say that if (D,C) is a lexical entry and C contains $[\alpha F]$, then (D,C) is necessarily a member of the lexical category K, with respect to this entry, and it is unnecessary (by virtue of convention [(2.0c)]) to list [+K] in C. (Chomsky 1965: 166; Chomsky's emphasis)

Here Chomsky's assumption is adopted

(2.0e) that the proper method for inserting lexical items is by a general rule that inserts the lexical entry (D,C) in a position ...Q... in a Phrase-marker (Q being a complex symbol developed by rewriting rules), where C is not distinct from Q in the technical sense of feature theory. (1965:164)

This general rule, being common to all grammars by convention, is not stated formally here.

2.1. N
$$\rightarrow$$
 CS (< 1.12, 1.13, 1.18)

- 2.1.0. Adopting the convention
- (2.1a) that among the lexical categories, ...Noun is the one that is <u>selectionally dominant</u> in the sense that its feature composition is determined by a context-free subcategorization rule, its features being carried over by selectional rules to other lexical categories (Chomsky 1965:116; Chomsky's emphasis),

it becomes obvious that the category Noun (N) must be rewritten as CS before any other category is so rewritten, considering that the proper selectional constraints on members of other lexical categories are dependent on the prior specification of Noun features.

2.1.1. The category Noun (N) is introduced in the PS rules rewriting VP (1.12), AdjP (1.13), and NP (1.18). Thus, Nouns are strictly subcategorized with respect to the following contextual features:

[Adj]	(1,13b)
[]	(1,17a, c, d)
[NomP]	(1,18a, b)
[#s#]	(1,18c)
[NomP^#S#]	(1.l8d)

There are no Nouns known to be positively specified for the contextual features preceded by asterisks (*) in (2.1b), such that no known Noun is verbalized by a Q-class Verb (1.12.2). (Equally, there are no Verbs known to be positively specified for contextual features involving [...N PunctP]; see 2.15.1.)

The following are examples of Nouns specified with respect to the above strict subcategorization features (together with example numbers under each contextual feature where an illustrative example has been given).

2.1.2. Serrano Nouns are subcategorized with respect to the syntactic features Multiple and Animate.

(2.1d) +N
$$\rightarrow \begin{bmatrix} \pm \text{Multiple} \\ \pm \text{Animate} \end{bmatrix}$$

The following are examples of Nouns with features specified according to (2.1d).

'little one'

Adverbial suffixes may be suffixed directly to [-Ani-mate] Nouns, but when they occur after [+Animate] Nouns, there must be transformationally introduced intervening material, as in the following example:

Strangely enough, the words meaning 'horse' (#kaba:-yu'#, #wa'u:+rabi'#) and the word meaning 'possessed animal, pet' (#a:či+# ~ #'a:či+ta#) in contexts where it means 'horse', are [-Animate], inasmuch as they can take directly suffixed adverbial material, as below:

2.1.3. All [+Animate] Nouns have the same sign for the syntactic feature Plural as they have for Multiple ([+Plu-ral] = "plural", [-Plural] = "singular"). Further, all [+Animate] Nouns are subcategorized with respect to the feature Human. These observations can be stated as:

(2.lh)
$$\begin{bmatrix} \alpha \text{Multiple} \\ + \text{Animate} \end{bmatrix} \rightarrow \begin{bmatrix} \alpha \text{Plural} \\ \pm \text{Human} \end{bmatrix}$$

Examples of such Nouns are the following:

(2.1i) #hukáh# [±Plural, -Human, +[__], ...] 'deer'

#go:ra# [±Plural, +Human, +[NomP__], ...] 'older

sister' (singular: (1.18a), plural: (1.16b))

#točíña+# [±Plural, +Human, +[__], ...] 'youth,

young man' (singular: (1.8h), plural: (1.17e))

The sign on the feature Human governs Determiner (2.2) selection, such that [+Human] Nouns cooccur with #hami#
'who', and [-Human] Nouns cooccur with #hi:+# 'what'. This opposition is neutralized for plural Nouns so far as Determiner selection is concerned, such that the Determiner corresponding to both #hami# and #hi:+# for plural Nouns is #hahi:+# 'who, what'. However, [+Plural] Nouns are marked for Human in anticipation that the sign for this feature will turn out to be relevant regardless of that for Plural

should detailed selectional rules for Verbs (2.15.2) be worked out.

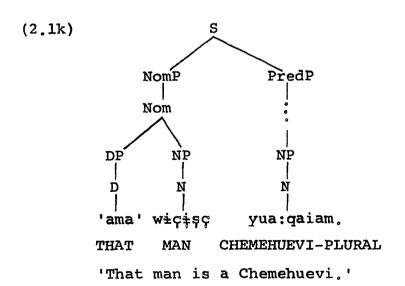

Some Nouns are only [+Plural], as the following:

(2.1j) #'acə# [+Plural, -Human, +[(NomP)__], ...] 'head lice'

#číl^yVka# [+Plural, +Human, +[__], ...] 'small children'

#yuhâ:qah# [+Plural, +Human, +[__], ...] 'Chemehuevi'

Most words for nationalities or local groups of people, like #yuha:qah# 'Chemehuevi', are [+Plural]. These are noteworthy in that they cooccur as predicate nominals with Nouns that are either plural, as in (1.17e), or singular, as in (2.1k).

Among the other Nouns with the same behavior as #yuha:qah# are #'alima:n# 'German', #franse:s# 'Frenchman', #kawi:yah# 'Cahuilla', #ku:+pah# 'Cupeño', and names for the
Serrano local groups: #ma:+rəna'# 'Morongo', #mə+hiha:'an#,
#'a+tə:'abiha+ta#, #mamahi:+ta#. (The phonetic forms of
the last four are cited in section 0.1.)

A number of [+Animate] Nouns are only [-Plural], as the following:

(2.11) #hu:nabV+# [-Plural, -Human, +[__], ...] 'badger'
#lalaba# [-Plural, -Human, +[__], ...] 'butterfly'

It is unknown how one would talk about more than one badger or butterfly.

2.1.4. Nouns that are [-Animate] but [+Multiple] are either singular or plural.

(2.lm)
$$\begin{bmatrix} +Multiple \\ -Animate \end{bmatrix} \rightarrow \begin{bmatrix} +Multiple \\ \pm Plural \end{bmatrix}$$

Compare the following examples:

(2.ln) 'awa:qa' wisip±'q,
HIS-SHOE BE-POINTED(-RESULTATIVE)
'His shoe is pointed.'

- (2,lo) 'awa;qa' wisisi'q.
 HIS-SHOE BE-POINTED(-RESULTATIVE)
 'His (one pair of) shoes are pointed.'
- (2.lp) 'awa:qam wisisi'q.
 HIS-SHOES BE-POINTED(-RESULTATIVE)
 'His shoes (of more than one pair) are pointed.'

These Sentences involve the Noun

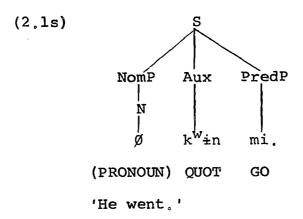

(2.lq) #wa:qa# [#Multiple, #Plural, +[NomP_], ...] 'shoe'

and the Verb 'become point-shaped', which has the form #wisis# with [+Multiple] Noun subjects and #wisi+p# with [-Multiple] Noun subjects (see section 2.15.4).

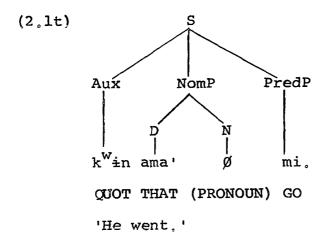

Many [-Animate] Nouns are [±Multiple], but if [+Multiple], they are necessarily [+Plural]. This is noted as: [±Multiple, +Plural], as, for example,

- (2.1r) #wal a+# [tMultiple, +Plural, +[(NomP)__], ...]
 'dish'
- 2.1.5. The PS rules make it clear that every Sentence contains at least one Noun. Yet a great number of Sentences contain no overt phonological representation of any Nomi-

nal-Phrase material. An example is:

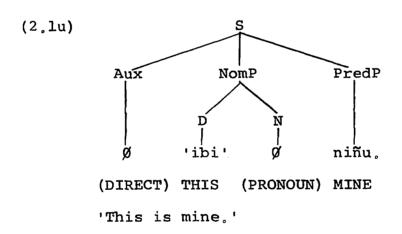

Also very common are Sentences in which such overt phonological material representing the NomP as does occur does not include any representation of the Noun head of the NomP, as in (2.1t).

Sentences such as (2.1s) and (2.1t) are described as involving "Pronouns." Pronouns cannot be described as re-

sulting from the deletion of some lexical item or items they may refer to, inasmuch as the unrecoverable deletion of lexical items is specifically disallowed as a possible transformational operation (Chomsky 1965:132). However, Sentences of this sort are not at all aberrant or unusual. In fact, thus far in this presentation, more than eighty examples of Sentences involving Pronouns have been given, and it seems fair to suppose that in just about any sort of discourse most Sentences will involve Pronouns. Furthermore, pronominalization cannot be handled by reference to a prior or following linguistic context because of examples like (2.1u), where the reference of the Pronoun is known to

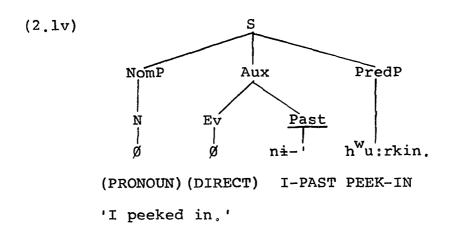

the listener wholly from the non-linguistic context of the Sentence.

Pronouns belong to the category Noun and are phonological ically zero, that is, they have no associated phonological

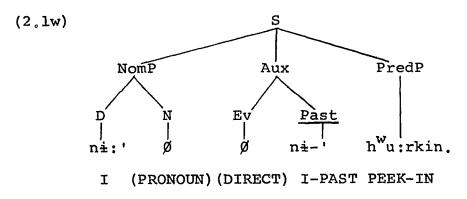

material. Pronouns are subcategorized to a certain extent, but their meaning, other than that which is revealed by the agreement patterns determined by the nature of their subcategorization, is simply that the listener has enough information from the context, either linguistic or non-linguistic, to determine who or what the speaker intends.

The subcategory Pronoun includes the Nouns indicating the speaker and the addressee, that is, the first and second persons, where the "meaning" of these Pronouns is known only by knowing who is speaking and who is being addressed.

Compare (2.1v) and (2.1w), in which the only difference be-

tween the two is the presence or absence of the Determiner #nəhə+# 'I' (see 2.2). It should be noted that the only difference in meaning between the two Sentences is that in (2.1w) there is more emphasis on the subject of the Sentence than in (2.1v).

'I peeked in.'

All Pronouns share the strict subcategorization feature +[__]. Thus, only Nouns having this feature are to be subcategorized with respect to the feature Pronoun. The feature [+Person] includes first and second person; third person is distinguished as [-Person]. Rule (2.1x) distinguishes Pronouns from non-pronouns, and (2.1y) and (2.1z) subcategorize the Pronouns.

$$(2.1x) + [__] \rightarrow \pm Pronoun$$

$$(2.1y) \begin{bmatrix} +Pronoun \\ +Human \end{bmatrix} \rightarrow \pm Person$$

$$(2,1z)$$
 +Person \rightarrow ±1stPerson

The Pronouns are listed in (2.laa). Note that no Pronoun has any associated phonological material.

```
(2.1aa) [+1stPerson, +Plural] 'we'
                                              (1.2c)
        [+1stPerson, -Plural] 'I'
                                              (2.1v-w)
        [-1stPerson, +Plural] 'you plural'
                                              (1.4g)
        [-1stPerson, -Plural] 'you singular' (1.19a)
        [-Person, +Plural] 'they'
                                               (1.15c)
        [-Person, -Plural] 'he, she'
                                              (2.1s-t)
        [+Pronoun, -Human, +Plural] 'they'
                                             (1.6h)
        [+Pronoun. -Human. -Plural] 'it'
                                              (1.3a)
        [+Pronoun, +Multiple, +Plural] 'they' (1.3c)
        [+Pronoun, +Multiple, -Plural] 'it, they' (1.11f)
        [+Pronoun, -Multiple, -Animate] 'it' (1.14a-b-c)
```

2.1.6. Another syntactic feature for Nouns is SgSuffix. Consider the following examples:

These examples illustrate the fact that some possessed Nouns, that is, Nouns having the feature +[NomP__], have a Singular suffix added before a case ending, while others have the case ending added directly to the Noun (4.3). Rule (2.1cc) specifies this.

$$(2.1cc) + [NomP_{\underline{}}] \rightarrow \pm SgSuffix$$

The Nouns of (2.1bb) will be listed in the lexicon as:

(2.1dd) #şu:na# [#Plural, +Human, -SgSuffix, ...] 'man's daughter'

#hi:nV+tu'a# [±Plural, +Human, +SgSuffix, ...]
'wife'

- 2.1.7. Some non-possessed Nouns take the absolutive suffix ta#. This is identical in form to the singular suffix ta# but behaves quite differently. The absolutive suffix and the singular suffix do not cooccur, and the absolutive suffix can occur before the plural suffix mi# and before adverbial suffixes, in which positions the singular suffix cannot occur. Compare the following examples. (The corresponding possessed forms are included to demonstrate that ta# Absolutive is not part of the Noun #pagá;+#.)
- (2.lee) paqi:-t 'shirt' ni-pa:qi' 'my shirt'

 paqi:-ta-m 'shirts' ni-pa:qi-m 'my shirts'

 paqi:-ta-b 'on the shirt' ni-pa:q-p 'on my shirt'

 qaikw-t 'rope' ni-qaikw 'my rope'

 qaikwu-m 'ropes' ni-qaikwu-m 'my ropes'

 qaikw-p 'on the rope' ni-qaikw-p 'on my rope'

The difference in the behavior of #paqo:+# and #gahiku+# is accounted for by

(2.1ff) -Pronoun → ±Absolutive

which allows the following lexical specification for these two Nouns:

- (2.lgg) #pagá:+# [#Multiple, +Plural, +Absolutive, +SgSuffix, ...] 'shirt'

 #gahíku+# [#Multiple, +Plural, -Absolutive, +SgSuffix, ...] 'rope'
- 2.1.8. Nominalizing suffixes are subcategorized with respect to whether their syntactic features must agree with those of the subject (1.2.3) of the embedded Sentence.
- $(2.1hh) + [\#S\#_] \rightarrow \pm Agree w/subject$

See sections 3.2.3-4 for transformations and examples.

- 2.1.9. The features [+Location] and [+Direction] must be distinguished for a number of Nouns. The Direction suffix yagá# is reduced to ká# after [+Location] Nouns (T6.17d). Examples of [+Location] Nouns are:
- (2.1ii) #tukúhpa# 'up, sky'

 #təhəbu# 'down, ground'

 #yəhəbu# 'outside'

Other reductions with adverbial suffixes involve [+Direction] Nouns, an example of which is that the Direction suffix yəqá# is optionally deleted after [+Direction] Nouns
(T6.17b). Examples of [+Direction] Nouns are:

(2.1jj) #k^wi:mVkə# 'north' #pəya:na# 'far' ##pəbənə# 'south' #warača# 'low desert, Imperial Valley'

The word for 'east', #'a+pu:#, has been observed only with the Direction suffix: ['apu:yka'] 'to the east', and consequently the word is not classified as [+Direction].

- 2.1.10. A few Nouns, as well as some Verbs, are marked as [+Reduce]. These lose their final syllable in certain contexts (T6.23a). Examples are:
- (2.1kk) #kákə# 'paternal grandrelative' #pohóga# 'road' #ná'ana# 'father' #yóka# 'mother'
- 2.2. $D \rightarrow CS$ (< 1.19, 1.21)
- 2.2.1. The category Determiner (D) is introduced in the PS rules rewriting NumP (1.19) and DP (1.21). Thus, Determiners are strictly subcategorized with respect to the following contextual features:

2.2.2. Determiners which have the selectional feature

-[__[+Person]], that is, Determiners preceding other than

Noun-Phrases whose Noun heads are first or second person

Pronouns, are subcategorized as follows:

(2.2b)
$$\begin{bmatrix} +D \\ -[-[+Person]] \end{bmatrix} \rightarrow Determinate$$

- (2.2c) +Determinate → ±Proximate
- 2.2.3. All Determiners have various features filled in transformationally such that they agree in certain respects with the Noun heads of the Noun-Phrases they precede. Those having the selectional feature +[__[+Person]] have the appropriate features regarding person and number filled in; the other Determiners have the appropriate signs for the features Plural, Animate, and Human filled in (3.1.9).

2.3. PreD
$$\rightarrow$$
 CS (< 1.21)

2.3.1. The category Pre-Determiner (PreD) is introduced in the PS rule rewriting DP (1.21). Thus, Pre-Determiners are strictly subcategorized with respect to the following contextual features:

- 2.3.2. The following two Pre-Determiners have been identified.
- (2.3b) #ta# [+PreD, +[__D], ...; +Ev, ...] Dubitative #tumV# [+PreD, +[__D(D)], ...] 'some' (?)

#ta# seems to be identical with the Dubitative Evidential (1.4, 2.6.3) inasmuch as it appears before the Indeterminate Determiner, which is identical in at least one of its forms (#ha#) with the Inferential Evidential #ha# (2.6.3). Compare (1.41) and (1.21c). The meaning of #tumV# is difficult to identify; it sometimes seems translatable as 'some-', as in 'something', or 'somewhere', which meaning seems already to be given by the Indefinite Determiner, which it precedes; see (1.21b-d).

2.4. Intens \rightarrow CS (< 1.6, 1.17)

2.4.1. The category Intensifier (Intens) is introduced in the PS rules rewriting Pred (1.6) and Nom (1.17). Thus, Intensifiers are strictly subcategorized with respect to the following contextual features:

(2,4a)	[AdjP]	(1,6d)
	[VblP]	(1,6h)
	[Manner^VblP]	(1.6j)
	[TS_AdjP]	(1.6f)
	[TSVblP]	(1,61)
	[TSManner^VblP]	(1,6m)
	[NP]	(1.17c)
	[DP^NP]	(1.17d)

- 2.4.2. The following are examples of Intensifiers, together with their positively specified contextual features.
- (2.4b) #číkVtV# [+Intens, +[__(DP)NP], ...] 'all, only'

 #hakup# [+Intens, +[(...TS)__AdjP], +[(...TS)__

 (Manner)VblP], +[__NP], ...] 'very'

 #ki+ti:# [+Intens, +[(...TS)__AdjP], +[__VblP],

 +[__NP], ...] 'a little'

 #močə# [+Intens, +[(...TS)__(Manner)VblP], ...]

 'again, any more'

2.5. Asp
$$\rightarrow$$
 CS (< 1.3)

- 2.5.1. The category Aspect (Asp) is introduced in the PS rule rewriting Aux (1.3). Thus, the contextual feature +[__EvP] is common to all members of this category, and consequently will not be overtly specified in the list of features for any Aspect.
- 2.5.2. The Aspects are either suffixes attached to the Verb stem or else modifications of the Verb stem. There are six members of this category: Future, Going-to, Perfective, Completive, Imperative, and Unmarked.
- 2.5.3. As there are six members of this category, it is possible to subcategorize Aspect with respect to three syntactic features: A, B, and C. So far, no appropriate labels for these features have come to mind, so for the meantime, these arbitrary labels will be used.

(2.5a)
$$+Asp \rightarrow \begin{bmatrix} \pm A \\ \pm B \end{bmatrix}$$

 $(2.5b) +B \rightarrow \pm C$

Rules (2.5a-b) subcategorize the Aspects, which are listed in (2.5c). Note that both Imperative and Future are selectionally restricted from cooccurring with the <u>Past</u> formative of the Evidential-Phrase.

(2.5c) <u>ib#</u> [+A, +C, -[__[...Past...]], ...] Future [+A, -C, ...] Perfective [+A, -B, -[__[...Past...]], ...] Imperative <u>ga#</u> [-A, +C, ...] Going-to <u>i+#</u> [-A, -C, ...] Completive [-A, -B, ...] Unmarked

Aspects with the feature [+A] seem to have to do with events somewhat less immediate than those with [-A]; [+B] indicates the removal in time away from the point of common focus (as indicated by Evidential-Phrase material), while [-B] covers both events yet to happen, [+C], and events that happened prior to the point of common focus, [-C].

2.5.4. The Future is marked by the suffix <u>ib#</u>. Examples with this Aspect are: (0.3b), (1.3b), (1.4k), (1.4n), (1.7b), (1.14b), (1.15a-b).

2.5.5. The Perfective is marked by modifying the Verb stem in a variety of ways. Compare the following Perfective and Unmarked forms (where [i] found at the end of some Unmarked forms represents your Accusative case (1.11.1)):

(2.5d) Perfective Unmarked mimi'q 'die' mimi' 'dead' mɨpɨ' 'swallowed' mɨnɨ 'kin 'swallow' rara:kW 'having eaten' ra:k^W 'eat (intr)' tutuh wtu 'having danced' tuh tu' 'dance' q^wq:q^wq' 'dead, pl subj' qwo'a-i 'die, pl subj' 'having shot' mu-i 'shoot' mu:m 'having done' ni:n Niha-i 'do' čiči:kin 'having poked' čiki:n 'poke' kwukwu:m 'gone to sleep' kwu:man 'sleep'

The reduplication marking the Perfective, as in several examples in (2.5d), should not be confused with the reduplications marking different Frequentatives (2.14). Reduplicative Frequentatives and the Perfective cannot cooccur (2.14.4).

2.5.6. The Imperative usually involves a modification of the end of the Verb stem, but quite often the Unmarked form of the Verb stem is not phonetically distinct from the Imperative form. Compare the following:

(2.5e) Imperative Unmarked

čia' či'a-i 'pick up' pi:' 'throw' pia:' wir wiha-i 'put' čaw čawe-i 'gather' nia Miha-i 'do' '±i 'iyi-i 'steal' *<u>Kurupkin</u>* 'put in' *<u>Kurupk</u>* ti:' 'roast' ti:' 'shoot multiple object' mu:m mu:m 'keep on cleaning' yarukab yarukab

Other examples involving the Imperative are (1.4b), (1.4d).

- 2.5.7. The Going-to Aspect seems to mark an assertion about a coming event. It is marked with the suffix <u>qå#</u>. Examples with this Aspect are: (1.3c), (1.4f), (1.11b), (1.12b), (1.14a).
- 2.5.8. The Completive marks an event as terminated before the point of common focus. It is marked by the suffix <u>i+#</u>. The following two examples show the contrast between Completive and Perfective:
- (2.5f) 'ubia k^Wu:man-i-t.

 ALREADY SLEEP-COMPLETIVE-SINGULAR

 'He already slept.'

- (2.5g) 'añi:'či' 'ubia k^wuk^wu:m.

 BABY ALREADY SLEEP-PERFECTIVE

 'The baby has already gone to sleep.'
- 2.5.9. The Unmarked Aspect is, as its name is intended to suggest, the zero form, as in (1.3a) and in many other examples throughout. It is necessary to recognize this as a phonologically (and semantically?) zero member of this category, rather than as simply the absence of any Aspect, because of the nature of the selectional rules for the Evidentials (2.6), which are restricted as regards the sign for the Aspect features A and B, which serve to differentiate this Aspect.

2.6. Ev
$$\rightarrow$$
 CS (< 1.4)

2.6.1. The category Evidential (Ev) is introduced in the PS rule rewriting EvP (1.4). Thus, Evidentials are strictly subcategorized with respect to the following contextual features:

[<u>Past</u>]	(1.40)
[<u>#ta#</u> <u>Past</u>]	(1.4p)
[Ev Past]	(1,4q)
[Ev^#ta# Past]	(1.4s)
[Ev]	(1.4m)
[<u>#ta#</u> ^Ev]	(1,4n)
[Ev^ <u>Past</u>]	(1.4q)
[<u>#ta#</u> ^Ev^Past]	(1.4s)
[<u> </u>	(1.4d)
*[<u>#ta# ?</u>]	
[Ev <u>?</u>]	(1.4j)
*[Ev^ <u>#ta# ?</u>]	
[<u>Past^?</u>]	(1.4e-h-i)
*[<u>#ta#Past^?</u>]	
[EvPast^?]	(1.4r)
*[Ev^ <u>#ta#Past^?</u>]	
[Ev^ <u>?</u>]	(1.4j)
*[<u>#ta#</u> ^Ev^?]	
[Ev^ <u>Past^?</u>]	(1.4r)
*[<u>#ta#</u> ^Ev^ <u>Past^?</u>]	

There are no Evidentials positively specified for the contextual features preceded by asterisks (*) in (2.6a), such that the Dubitative #ta# in Questions is always lexically introduced; see 2.6.3.

- 2.6.2. Evidentials are selectionally restricted with respect to Aspect features (2.5). Also, the Volitative Evidential #na'a# seems to be restricted to cooccurring with first person plural subject.
- 2.6.3. The following is a list of the Evidentials so far identified, specified as fully as can be done at this time. (See 4.32 for the feature M.)
- (2.6b) [+Ev, +[__(Past)], -[[Future]__], -M, ...] Direct #ha# [+Ev, +[(Ev) #ta# ___(Past)], -[[Imperative]...]. +M. ...] Inferential (Inf) $\#k^{W} \ni ' \ni \# [+Ev, +[(Ev)(\#ta\#)_{(?)}], -[[-A]..._],$ -[[+B]..._], -M, ...] Potential 'can' #kWana# [+Ev, +[(Ev)(#ta#) (Past)], -[[Imperative] ...]. +M. ...] Quotative (Quot) #may# ~ #miha:# [+Ev, +[__(#ta#)(Ev)(Past)], -[[Future] _], -M, ...; +[__Ev], -M, ...] 'may' #na'a# [+Ev, +[__], -[[+A]__], -[[+B]__], -[[-Animate] or [-Plural] or [-Human] or [-Pronoun] or [-Person] or [-1stPerson] ~ PredP ~ Asp__], -M. ...] Volitative #pata# [+Ev, +[__(#ta# ~ Ev (Past))], +M, ...; +Intens, ...] Intensive #gáy# [+Ev, +[__(#ta#)(Ev)(Past)], -[[Future]__], -M, ...; +[__Ev(Past)(?)], -M, ...] 'not'

Thus, #kwa'a# Potential is selectionally restricted to cooccurring with Imperative Aspect, #na'a# Volitative with the Unmarked Aspect (2.5.3). #ta# Dubitative occurs only together with Future, or in Questions. #ta# Dubitative is also a Pre-Determiner (2.3.2) and #pata# Intensive is also an Intensifier (2.4b). #may# 'may' and #cay# 'not' cooccur with Future only when positively specified for features involving [_Ev...]. The only Evidential that can cooccur with the Future Aspect without #ta# Dubitative, other than #ta# itself, is #kwana# Quotative, as in (2.6c).

- (2.6c) pimia' kwini-č qaçib.

 WITH-HIM QUOT-WE DWELL-FUTURE

 'We would live with him (so we were told).
- 2.7. Interjection \rightarrow CS (< 1.1)
- 2.7.1. The category Interjection is introduced in the first PS rule rewriting S (1.1). Thus, all Interjections are characterized by the contextual feature +[__]. Because this feature is common to all members of this category, it

will not be overtly specified in the list of features for any Interjection.

- 2.7.2. The following is a sample list of Interjections.
- (2.7a) #'eya'# [+Interjection, ...] 'hey!'

 #hami(:)na+ta# [+Interjection, ...] 'hello'

 #ha:h# [+Interjection, ...] 'yeah, oh'

 #now# [+Interjection, ...] 'no'

 #wa+rə'# [+Interjection, ...; +Adv_S, ...] 'yes,
 indeed'

Note that $\frac{\#wa+r\vartheta'\#}{\#}$ is a member of the category Sentence Adverb (Adv_S) in addition to Interjection.

2.8. Conj
$$\rightarrow$$
 CS (< 1.1, 1.5, 1.16)

2.8.1. The category Conjunction (Conj) is introduced in the PS rules rewriting S (1.1), PredP (1.5), and NomP (1.16). Thus, Conjunctions are strictly subcategorized with respect to the following contextual features:

Because only Conjunctions have any positively specified contextual features of those listed in (2.8a), it is unnecessary to include the notation +Conj in the list of features for any Conjunction.

2.8.2. The following is a list of the Conjunctions so far identified.

Note that #'ani:#, #'ayahɔ+#, and #yanaqə# are members of other lexical categories in addition to Conjunction.

2.9. Num
$$\rightarrow$$
 CS (< 1.19)

2.9.1. The category Numeral (Num) is introduced in the PS rule rewriting NumP (1.19). Thus, Numerals are strictly subcategorized with respect to the following contextual features:

2.9.2. Numerals are selectionally restricted with respect to multiplicity of subject, such that, for example, #həhūkup# 'one', when having the contextual feature +[__], cannot cooccur with [+Multiple] subjects, or #woh# 'two' with a [-Multiple] subject.

(The features [NomP[Nom...Nom]^PredP[..._...]] and [NomP[...[+Multiple]]^PredP[..._...]] are together referred to by the graphically simpler label [+Multiple] subject; the feature [NomP[Nom[...[-Multiple]]]^PredP[..._...]] is referred to as [-Multiple] subject.)

- 2.9.3. The following is a list, in "numerical" order, of the first four Serrano Numerals and also the indefinite Numeral iffiki#.

#wačah# [+Num, +[(PreNum)__], -[-Multiple] subject,
...] 'four'
ifiiki# [+Num, +[D__], ...] 'how many, how much'

- 2.9.4. The words for 'hundred', #'a+hǫn'ka'# (Sarah Martin), #sye:ntu# (Louie Marcus), are not Numerals but Nouns (2.1), as demonstrated by the fact that Numerals preceding them are simple, that is, not in a Pre-Numeral (1.20) form.
- (2.9c) houk p sie:ntu' (Louie Marcus)
 'one hundred'
- (2.9d) woh 'ahɨn 'ka' (Sarah Martin)
 'two hundred'
- 2.9.5. Whether the word for 'half', ['i:hk^wp], should be classified as a Numeral is unclear for lack of convincing examples. Whether fractions other than 'half' can be expressed in Serrano is unknown.

2.10. Ben
$$\rightarrow$$
 CS (< 1.15)

2.10.1. The category Benefactive (Ben) is introduced in the PS rule rewriting BenP (1.15). Thus, Benefactives are strictly subcategorized with respect to the following contextual features:

$$(2.10a)$$
 [NomP__] (1.15a-b)

- 2.10.2. There is no apparent meaning difference between the two members of this lexical category. The two Benefactives are strictly subcategorized as follows:
- (2.10b) <u>ičuna#</u> [+Ben, +[NomP(Ben)_], ...] Benefactive suffix

The Benefactive suffix, <u>ičuna#</u>, is transformationally reordered to appear after the Verb-Phrase (3.1.4). The Direction suffix, <u>yaqá#</u>, is both a Benefactive and an Adverb of time-space (2.12).

2.11.
$$Adv_S \rightarrow CS$$
 (< 1.7)

2.11.1. The category Sentence Adverb (Adv_S) is introduced in the PS rule rewriting Adv (1.7). Thus, Sentence Adverbs are strictly subcategorized with respect to the following contextual features:

(2.11a) [__] (1.7a)
$$[_Adv_{TS}^{\#S\#}]$$
 (1.7b)

- 2.11.2. The following are examples of Sentence Adverbs, together with their positively specified contextual features.

2.12.
$$Adv_{TS} \rightarrow CS$$
 (< 1.7, 1.8, 1.20)

2.12.1. The category Adverb of time-space ($\mathrm{Adv}_{\mathrm{TS}}$) is introduced in the PS rules rewriting Adv (1.7), TS (1.8), and PreNum (1.20). Thus, Adverbs of time-space are strictly subcategorized with respect to the following contextual features.

(2.12a)
$$[Adv_S_{-}#S#]$$
 (1.7b) $[_{-}]$

[NomP_] (1.8d)

[NomP ~ yə# __] (1.8e)

[NumP__] (1.8f), (1.20a)

[#S#__] (1.8g)

- 2.12.2. Sample Adverbs of time-space are listed below.
- (2.12b) #'ahku# [+Adv_{TS}, +[__], ...] 'here' #'amahi+# [+Adv_{TS}, +[__], ...; +N, ...] 'now, present time; new one' #'ibina# [+Adv_{TS}, +[__], ...] 'yesterday, in the recent past' #'uba:'ima# [+Adv_{TS}, +[__], ...] 'in the morning, tomorrow' #bV# [+Adv_{TS}, +[NomP__], -[[+Animate]__], ...] 'on' <u>i((ha):)</u># [+Adv_{mg}, +[NomP__], +[NumP__], -[[+Animate]__], ...] 'time(s)' miha'a# [+Advmg, +[NomP(yə#)], ...] 'together with' <u>nu'u#</u> [+Adv_{TS}, +[NomP__], +[NumP__], ...] 'from' pa(')# [+Adv_{TS}, +[Adv_S_#S#], +[NomP_], +[NumP __], ...] Location suffix: 'at, in, on' pa'anV# [+Adv_{TS}, +[NomP__], -[[-Pronoun]__], -[(Intens)NP__], -[[+Determinate]__], ...]

Time suffix: 'when'

2.13.
$$Adv_{manner} \rightarrow CS$$
 (< 1.9)

2.13.1. The category Adverb of manner (Adv_{manner}) is introduced in the PS rule rewriting Manner (1.9). Thus, Adverbs of manner are strictly subcategorized with respect to the following contextual features:

2.13.2. Sample Adverbs of manner are listed below.

- nə# [+Advmanner, +[NomP__], -[[+Animate]__], ...]
 Instrumental case: 'with, using'
 #wo+hana# [+Advmanner, +[NomP__], -[[-Animate]__],
 ...] 'both, together with'
 "..." [+Advmanner, +[...#S#__], ...] '"..."'
- 2.13.4. The last Adverb of manner listed above deserves special comment. Direct quotations in Serrano, as in (2.13c), are Manner adverbials. This is demonstrated by
- (2.13c) "pa:kihac 'ani bɨ qwo:n" qɨi kwɨn.

 HAWK AND HE-THEM KILL SAY QUOT

 '"It was the Hawk, and he killed them," he said.'

the question form, which is not 'What did he say?' as in English, but, literally, 'How did he say-it?' as in (2.13d).

(2.13d) Adv manner [hamin] tabi' qii.

HOW DUB-HE-PAST SAY

'What did he say (verbatim: How did he say [it])?'

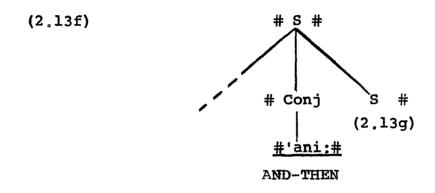

Indirect quotations, on the other hand, are independent Sentences, involving the Quotative Evidential. (2.13e) involves an indirect quotation within a direct quotation. (2.13f-g-h-i-j) represent the deep structure of (2.13e).

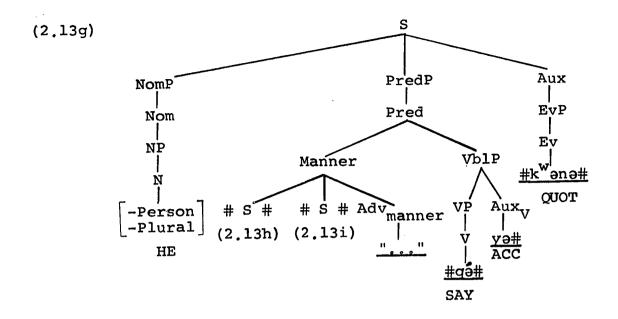

(2.13e) ... 'ani kwin qii "ama' mi:ŋaht qii. kwinimini

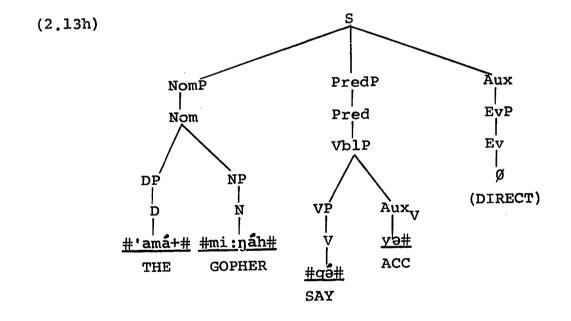

AND-THEN QUOT SAY THE GOPHER SAY QUOT-PLU
ç tabib ki:č 'atii'ab."

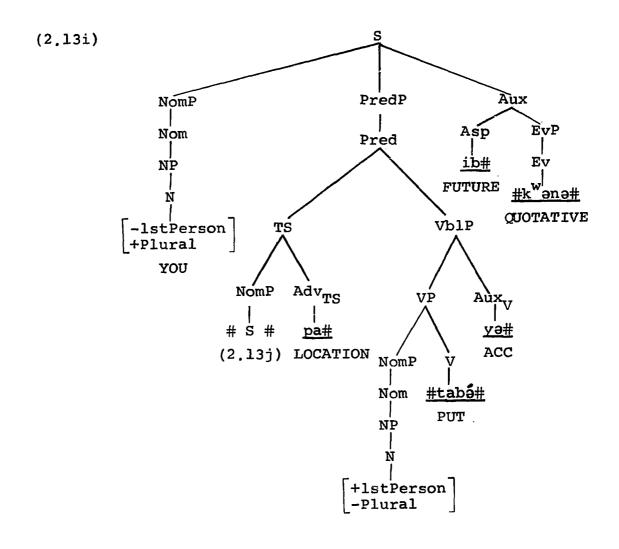

RAL-ME YOU PUT-FUTURE IN-THE-BIG-HOUSE

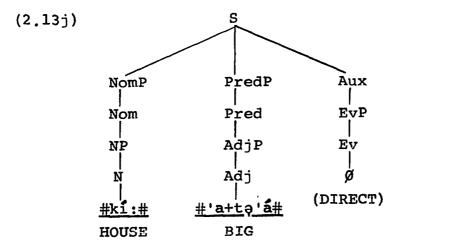

'... and then he said, "The Gopher said that you should put me in the Big House." (verbatim: ... and then he said, "The Gopher said [it]. You plural should put me in the Big House, it is said.")'

2.14. Freq
$$\rightarrow$$
 CS (< 1.11)

2.14.1. The category Frequentative (Freq) is introduced in the PS rule rewriting $\mathrm{Aux}_{\mathrm{V}}$ (1.11). Thus, Frequentatives should be strictly subcategorized with respect to the contextual features of (2.14a), but the occurrence of dif-

ferent Frequentatives has not been observed to have any dependency on the presence or absence of <u>cu'a#</u>, the Motion suffix, and so all Frequentatives are seen as having the same strict subcategorization specification, +[__(<u>cu'a#</u>) <u>yə#</u>]. This being the same for all Frequentatives, it is not overtly specified in the list of features for any Frequentative.

2.14.2. Frequentatives express chiefly the ideas of iteration and distribution in time or space. The differences among the various Frequentatives remain somewhat unclear, so it is assumed that, except where noted otherwise, there are as many lexically distinct Frequentatives as there are distinct phonological devices to realize them.

- 2.14.3. Most Frequentatives involve reduplication of part or all of the Verb, and all are transformationally reordered to precede the Verb.
- 2.14.4. The one Frequentative that does not involve reduplication is <u>aba#</u>, indicating iterative action or action distributed among multiple object, one at a time. This is the only Frequentative positively specified for the selectional feature [#S#^V_]; all other Frequentatives are negatively specified for this feature. The only Verb that can appear in #S#_ is the Causative suffix <u>ina#</u> (see 2.15.6). <u>aba#</u> suppletes not only <u>ina#</u> but also the Punctual suffix from the embedded Sentence which may precede ina#, as in the following examples.
- (2.14b) nirir-qi-i bi'.

 MOVE-PUNCT-ACC IT-PAST

 'It moved.'
- (2.14c) S[ŋ±r±r-k-] V[-ina-] -i b±'.

 MOVE-PUNCTUAL CAUSATIVE ACC HE-PAST

 'He moved it.'
- (2.14d) S[$\eta \pm r \pm r -$] V[$-\emptyset -$] Freq[-aba] -i $b \pm '$.

 MOVE ITERATIVE ACC HE-PAST 'He kept moving it.'

When the Verb of the embedded Sentence is of the shape #CVCV#, the form mV# is transformationally substituted for aba#, and the Verb ina# is not deleted, as in the following examples.

- (2.14e) S[n±b-k-] V[-ina-] -i m±.

 BURY-PUNCTUAL CAUSATIVE ACC THEY-THEM

 'They buried them.'
- (2.14f) S[n±b±-] Freq[-m-] V[-ina-] -i n±.

 BURY ITERATIVE CAUSATIVE ACC I-THEM

 'I was burying them (one at a time).'
- 2.14.5. Reduplicative Frequentatives and Perfective Aspect (2.5.5) do not cooccur. Thus the syntactic redundancy rule (2.14g).
- $(2.14g) [\#S\#^V_] \rightarrow -[_...[+A,-C]]$

This observation makes clear the analysis of certain problem Verbs which appear always to be reduplicated. An example is #tuhtu'a# 'dance', the Perfective form of which is [tutuh tu'] (cited in (2.5d)). This demonstrates that the underlying form of 'dance' is indeed #tuhtu'a# and not *#tu'a#, which would be lexically restricted to cooccurring with the Frequentative prefix #CVh. See section 2.15.5, however, for the exceptional Verb 'laugh'.

2.14.6.0. The phonological specification of some reduplicative Frequentatives seems fairly straightforward.

2.14.6.1. #CV+ reduplication indicates duration or distribution.

(2,14h) hihi n.

'I see it (durative).'

cp. tan hi:b.

'I'll see it (punctual).'

(2.14i) yaya'.

'He's running around.'

cp, ya'i,

'He runs,'

- 2.14.6.2. $\#C\hat{V}$: reduplication indicates iteration or duration.
- (2.14j) pi:bi'ai ni'.

'I was throwing things; I was hitting him with thrown objects.'

cp. pi:'ai ni'.
 'I threw it (once); I hit him (once) with
 a thrown object.'

(2.14k) qa:qaqq.

'It's croaking.'

cp. qa:qq.

'It croaked (once).'

- 2.14.6.3. $\#C\hat{V}h$ reduplication indicates iteration or repetition. The addition of this prefix makes the Verb become short.
- (2.141) pihpč 'be arriving' cp. piči-i 'arrive'

 čahčçu' 'be singing' cp. ča:çu' 'sing'
- 2.4.7. Other Frequentatives are more difficult to state in neat formulas. One pattern involves the duplication of the Verb.
- (2.14m) ya'ya'i n.
 'I'm running around.'
 cp. ya'i n.
 'I run, am running.'

- (2.14n) hwa:phwapq. 'He's jumping.'

 cp. hwa:pq. 'He jumped (once).'
- (2.140) tikaltikalq, 'Lightning flashes (repetitive).'

 cp. tikalq, 'Lightning flashed (once).'

Another pattern of duplication involves some reduction in the length of the Verb.

- (2.14p) hwathwatq 'be climbing around'

 cp. hwa:tg 'climb (punctual)'
- (2.14q) čon'čon'q 'stand up (repetitive)'

 cp. čonu'q 'stand up (punctual)'

An Intensive form involves the reduplication of the initial CVC with added length.

- (2,14r) ma:nmana'qçu'ai Čɨmɨ'.

 'We (finally!) came back.'

 cp. mana'qçu'ai Čɨmɨ'.

 'We came back.'
- (2.14s) $xa:1^{y}xa1^{y}a^{y}$. 'He (really) tickled her.' cp. $xa1^{y}a^{y}$. 'He tickled her.'

2.15.
$$V \rightarrow CS$$
 (< 1.12, 1.13)

2.15.1. The category Verb (V) is introduced in the PS rules rewriting VP (1.12) and AdjP (1.13). Thus, Verbs are strictly subcategorized with respect to the following contextual features:

(2.15a)	[]	(1,12a)
	[NomP]	(1,12b)
	[NomP^NomP]	(1,12c)
	[N_]	(1,12d)
	[NomP^N_]	(1,12e)
	[AdjP]	(1.12f)
	*[NomP^AdjP]	
	[#S#]	(1,12g)
	[PunctP]	(1,12h)
	[NomP_PunctP]	(1.12i)
	*[NomP^NomPPunctP]	
	*[NPunctP]	
	*[NomP^N_PunctP]	
	[AdjPPunctP]	(1,12j)
	*[NomP^AdjPPunctP]	
	*[#S#PunctP]	
	[Adj]	(1.13c)
	[PunctP^Adj]	(1,13d)

There are no Verbs known to be positively specified for the contextual features preceded by asterisks (*) in (2.14a).

2.15.2. Verbs are selectionally restricted as regards multiplicity of subject and object Nouns. (See 1.2.3 for "subject" and 1.12.1 for "object.") Verbs may well also be selectionally restricted as regards the features Animate and Human of subject and object Nouns, but there are no known examples where violations of constraints along these lines would have any worse consequences than tending to make Sentences difficult to construe. [±Multiple] subject are defined in section 2.9.2. Other terms are defined below.

(2.15b) [+Multiple] object:

$$[VP[\left\{\begin{array}{c}Nom...Nom\\...[+Multiple]\end{array}\right\}]\left(\left\{\begin{array}{c}N\\AdjP\end{array}\right\}\right)_{--}]$$

(2.15c) [-Multiple] object:

[VP[Nom[...[-Multiple]](
$$\left\{\begin{array}{c}N\\AdjP\end{array}\right\}$$
)__]]

(2.15d) [+Multiple] direct object:

- 2.15.3. The Verbs 'die' and 'kill' are excellent illustrations of the fact that Verbs may be selectionally restricted with respect to [±Multiple] subject or object. These Verbs are listed in (2.15h). Note that of these four Verbs, only #məmə'# is unrestricted as to multiplicity.
- (2.15h) #məmə'# [+V, +[__PunctP(Adj)], ...] 'die; be

 sick, hurt' (1.2c), (1.4c)

 #məkəna# [+V, +[NomP__], -[+Multiple] object, ...]

 'kill' (1.12b)

 #qo'a# [+V, +[__(Adj)], -[-Multiple] subject, ...]

 'die; be sick, hurt' (1.4n)

 #qo:na# [+V, +[NomP__], -[-Multiple] object, ...]

 'kill' (2.13c)

- 2.15.4. Many Verbs which are selectionally restricted with respect to multiplicity of subject or object have phonologically similar complementary forms, as in the following list.
- #čonú'u# [+V, +[__PunctP], -[+Multiple] subject, (2.15i)...] 'stand, stop' #čonono# [+V, +[__PunctP], -[-Multiple] subject, ...] 'stand, stop' #muhi# [+V, +[NomP], -[+Multiple] object, ...] 'shoot, sting' #mu:mə# [+V, +[NomP], -[-Multiple] object, ...] 'shoot, sting' #tə:'awana# [+V, +[NomP__], -[+Multiple] object, ...] 'count' #tə:'əwəma# [+V, +[NomP__], -[-Multiple] object, ...] 'count' #wisi+pi# [+V, +[__PunctP], -[+Multiple] subject, ...] 'form a point' (2.1m)#wisisi# [+V, +[PunctP], -[-Multiple] subject, ...] 'form points' (2.ln-o)
- 2.15.5. The Verbs 'laugh' seem to be unique in that one of these Verbs requires there to be some Frequentative, while the other is reduplicated in its underlying form,

such that however one chooses to say 'laugh' in Serrano, the Verb must appear reduplicated. There seem to be two different, but related, underlying forms for 'laugh'. These can be specified as in (2.15j).

So far, no meaning differences between the two forms have been found. The following forms involving these two Verbs have been observed.

(2.15k) mamXi bi'. 'He was laughing.' $k^{W} in i mahmamX. 'They were laughing.'$ $k^{W} in mahmaq. 'He was laughing.'$

[mahmamX] is #mámaqə# together with the #CVh reduplicative Frequentative (2.14.6.3). An alternative analysis, instead of specifying #maqə#, would specify the longer form #mahmaqə#; but this would need, then, the specification of the selectional feature -[_[+Freq]].

2,15.6. The following is a sample list of Verbs:

```
(2.15l) <u>'na#</u> [+V, +[NomP^N_], -[[+Animate]__], ...]
               Verbalizer
                                                       (1.12e)
         'na# [+V, +[AdjP__], ...] Stative verbalizer
                                                       (1.12f)
         #ču+ru+p# [+V, +[__PunctP], ...] 'enter'
                                                       (1.12h)
         (ha)p# [+V, +[AdjP__PunctP], ...] 'increase,
               quality becomes more intense'
                                                       (1,12j)
         h# [+V, +[AdjP__PunctP], ...] Stative verbalizer
         #ha: ča# [+V, +[__PunctP], +[__Adj], ...] 'become
               sharp'
                                                        (1.13c)
         <u>ina#</u> ~ <u>na#</u> ~ ... [+V, +[#S#__], ...] Causative
                                                       (1.12g)
         #maga# [+V, +[NomP^NomP__], ...] 'give'
                                                       (1.12c)
         #miha:# [+V, +[__], ...] 'go'
                                                       (1,12a)
         #nəbə# [+V, +[__PunctP], ...] 'become buried
                                                     (2.14e-f)
         \#n \ni m \ni \# [+V, +[__], ...] 'walk, be about' (1.2a)
         \#q\hat{3}\# [+V, +[(NomP)__], ...] 'say' (1.4c), (2.13e)
         #ra:k<sup>w</sup>a# [+V, +[__], ...; -Multiple, +[NomP__],
               -SqSuffix. ...] 'eat; food' (2.5d); (1.5a)
         <u>tu'a</u># [+V, +[N__], ...] Verbalizer
                                                       (1,12d)
```

2.16. Adj
$$\rightarrow$$
 CS (< 1.13)

2.16.1. The category Adjective (Adj) is introduced in the PS rule rewriting AdjP (1.13). Thus, Adjectives are

strictly subcategorized with respect to the following contextual features:

2.16.2. Adjectives are subcategorized according to various criteria. Some Adjectives are reduplicated when they appear before certain Verbs, in particular, the Stative verbalizers 'na# and h# (2.151); other Adjectives are not reduplicated in these positions. Because the only Adjectives that are reduplicated share the contextual feature +[__], the rule can be stated in terms of that feature:

$$(2.16b) \begin{bmatrix} +Adj \\ +[_] \end{bmatrix} \rightarrow \pm Redup$$

[+Redup] Adjectives are reduplicated according to the following patterns, depending on their underlying form. Adjectives consisting only of #CVCV# are reduplicated as in (2.16c).

$$(2.16c) \quad c_1 v_1 c_2 v_2 \quad \rightarrow \quad c_1 v_1 c_2 v_2 : c_1 v_1 c_2 v_2$$

Longer Adjectives are reduplicated as in (2.16d).

 $(2.16d) \quad c_1 v_1(:) c_2 v_2(:) (c_3...) \quad \rightarrow \quad c_1 v_1(:) c_2 v_2 : c_2 v_2$

Illustrative examples, with the Stative verbalizing suffix 'na#, are:

- (2.16e) Adj['±č±:-] V[-'na-] -i n,

 COLD STATIVE ACC I

 'I'm cold.'
- (2.16f) Adj[yi'a:yi'a-] V[-'n] kwin waha'.

 BEAUTIFUL STATIVE QUOT ALSO

 'It was beautiful too.'
- (2.16g) Adj[yaru:ru-] V[-'na-] -i mi'.

 CLEAN STATIVE ACC THEY-PAST

 'They were clean.'
- 2.16.3. Some Adjectives have the selectional feature
 -[__[-V]], that is, they appear nowhere but in the context
 of a verbalizing suffix. Examples are:
- (2.16h) #ra'u# [-Redup, -[__[-V]], ...] 'green, blue,'

2.16.4. One Adjective is phonologically discontinuous, consisting of both a prefix and a suffix:

The prefix portion is transformationally reordered to precede the Verb. Examples of Verbs adjectivalized with this Adjective are:

2.16.5. The following is a sample list of Adjectives:

3. THE TRANSFORMATIONAL CYCLE

3.0. The transformations of this section are applied in a cyclic fashion: transformations of section 3.1 are applied exclusively to Phrase-markers not containing #...#; the boundaries may then be removed by the embedding transformations of section 3.2, and then the output of section 3.2 is again cycled through the transformations of section 3.1. This process continues until there is no structure to which any transformation of either 3.1 or 3.2 applies.

An attempt has been made here to be completely explicit as to how the transformations restructure Phrasemarkers. This attempt has unfortunately rendered many transformations very difficult to read.

In writing transformations here, the convention has been that the material to the left of the transformational double arrow (⇒), plus any conditions stated below the transformation, represents the Structural Index or Structural Description, and the difference between the stated Structural Index and the material found to the right of the double arrow represents the Structural Change.

- 3.1. Agreement transformations.
- 3.1.1. Insertion of Genitive case and possessive prefixes in the Noun-Phrase (cf. PS rule 1.18, examples (1.18b-d).

T3.1.1. NomP
$$\cap$$
 N \Rightarrow NomP \cap Gen \cap $\#$ \cap [+Pos] \cap N

where both NomP and N are immediately dominated by NP

The introduction of the phonological boundary symbol # is a device to guarantee that [+Pos] is word-initial. This phonological boundary # should not be confused with the syntactic boundary #.

3.1.2. Introduction of Reflexive #taga+# 'self'.

T3.1.2. W[X]
$$\sim$$
 Y \sim Z[A[B \sim $\begin{bmatrix} +N \\ \alpha Plural \\ \beta Person \\ \gamma lst Person \end{bmatrix}$]] \sim C \Rightarrow

 $Z = NomP \underline{not}$ immediately dominated by

A = internal structure of Z

A = X

 $C \neq Genitive case (Gen)$

Reflexive is phonologically specified as #taqa+# in section 5.7. The following examples illustrate the use of the Reflexive #taqa+# 'self'. In (3.1.2a-b) #taqa+# is substituted for the direct object (1.12.1). It has reflexive reference in (3.1.2a) and reciprocal reference in (3.1.2b). In (3.1.2c) #taqa+# occurs in a Time-Space adverbial.

- (3,1,2a) nitaqan čikɨp wiha:n.

 MYSELF-I POKE THORN-INSTRUMENTAL

 'I pricked myself with a thorn.'
- (3.1.2b) kwini pi:taX pi:ha'n.

 QUOT-THEY THEMSELVES LOVE

 'They loved each other.'
- (3.1.2c) k^winimi' pi·taXaika 'ina:ç bira:bira'n.

 QUOT-THEY-PAST TO-THEMSELVES NICELY BE-TALKING

 'They talked together nicely.'
- 3.1.3. Substitution of <u>uka#</u> for the Adverb of time-space <u>miha'a#</u> 'with' with <u>Reflexive</u>.

T3.1.3.
$$\begin{bmatrix} +Pos \\ \alpha Feature \end{bmatrix}$$
 $\sim \underbrace{Reflexive \cap miha'a\#} \Rightarrow \begin{bmatrix} +AdvPos \\ \alpha Feature \end{bmatrix} \sim \underbrace{ukə\#}$

Examples are:

- (3,1,3a) pinuk t yei: 'b.

 WITH-HIMSELF DUB TAKE-FUTURE

 'He'll take it with him.'
- (3.1.3b) noukin qaç.

 BY-MYSELF-I BE
 'I'm all alone.'
- 3.1.4. Benefactive-Phrase adjustments and the destruction of the Verb-Phrase node (cf. PS rule 1.15, (1.15a-b-c)).
- T3.1.4. (BenP[NomP (\underline{y}) (\underline{i}) (\underline{i}) VP[X] \Rightarrow

The Nominal-Phrase dominated by BenP in the deep structure is now immediately dominated by VblP and participates in the subject-object agreement pattern specified in 3.1.11.

- 3.1.5. Insertion of Genitive case in the Time-Space adverbial (cf. PS rule 1.8).
- T3.1.5a. TS[X \sim [+Animate] \sim Adv_{TS}] \Rightarrow

$$TS[X \cap [+Animate] \cap \underline{Gen} \cap Adv_{TS}]$$

Later, T3.1.6, adverbial possessive prefixes are introduced within the Time-Space adverbial. For an example of animate Noun Genitive case within the Time-Space adverbial, see (2.1f). Contrast this with an inanimate Noun with an Adverb of time-space suffixed directly: #qahi:# yəqá# [qai:yka'] 'to the hill(s)', as in (1.17e).

T3.1.5b.
$$TS[X \cap N \cap Adv_{TS}] \Rightarrow TS[X \cap N (Gen) Adv_{TS}]$$

The option of including the Genitive case and adverbial possessive prefix (see 3.1.6) even for [-Animate] Nouns in adverbial constructions was a great help for the informant when the morphophonemic behavior of forms was difficult to recall. Consequently, early on during field work many forms were collected involving Genitive case which were subsequently collected with the Adverb suffixed directly to the Noun, as morphophonemic behavior of the Noun was recalled. Compare the following.

- (3.1.5a) qa:q^Wč pinu' (elicited June 26, 1963)

 SAGE-GEN FROM-IT

 'from the sage bush'
- (3.1.5b) qa:q^Wqnu' (elicited July 23, 1963)
 'from the sage bush'

3.1.6. Insertion of adverbial possessive prefixes before Adverbs of time-space.

T3.1.6.
$$\left\{\frac{y \ni \#}{Gen}\right\} [+Adv_{TS}] \Rightarrow \left\{\frac{y \ni \#}{Gen}\right\} \# \cap [+Adv_{TS}] \cap [+Adv_{TS}]$$

yə# Accusative case

Gen = Genitive case

AdvPos = Adverbial possessive prefix

is to guarantee that [+AdvPos] is word-initial. For examples, see (1.8e) for \underline{y} # # [+AdvPos] # [+AdvPos], and (2.1f) or (3.1.5a) for \underline{Gen} # [+AdvPos] # [+AdvPos]. In all three examples the shape of the adverbial possessive prefix is [p½-]. Note that T3.1.6 applies equally to the Benefactive \underline{y} \underline{y}

3.1.7. Genitive case in Manner adverbials (cf. PS rule 1.9).

The only Adverb of manner that is selectionally permitted

to appear in the environment specified in T3.1.7a so far identified is #wo+hana# 'both, together with'. Of constructions involving Genitive case this one is unique in that the presence of Genitive case does not entail any possessive prefix. An example is:

(3.1.7a) 'anančui'bt wohanam win papia.

HER-LATE-FATHER-GEN BOTH-THEY LIE THERE

'Together with her late father they lay there

(i.e., she and her late father both lay there).'

The syntax of #wo+hana# is an especially confusing problem. The pattern is usually that of a pair of Nouns involved, here 'she' (a Pronoun, phonologically zero) and 'her late father', one is found with Genitive case, while both seem to be the subject or object. Sometimes, however, the Noun associated with #wo+hana# is plural, in which case it follows #wo+hana#. This is accounted for by T3.1.7b and is exemplified in (3.1.7b).

- T3.1.7b. Manner[X ∩ [+Plural] ∩ Gen ∩ Adv_{manner}] ⇒

 Manner[X ∩ Adv_{manner} ∩ [+Plural] ∩ Gen]
- (3.1.7b) 'amač wɨçɨsc wohan 'atɨ:yɨm nɨ hihiy.

 THAT-GEN MAN'S BOTH HIS-WIVES-GEN I-THEM SEE
 'I saw both of that man's wives.'

#wo+hana# is suspiciously similar to the Numeral #wo+h# 'two' in both form and meaning, but so far no way to relate the two words syntactically in a principled way has been found.

3.1.8. Insertion of adverbial possessive prefix in Pre-Numerals (cf. PS rule 1.20).

T3.1.8. Num
$$\land$$
 Adv_{TS} \Rightarrow Num \land \pm \land [+AdvPos] \land Adv_{TS}

where
$$Adv_{TS} \neq \underline{i((ha):)#}$$
 'time(s)'

For an example, see (1.20a), where the adverbial possessive prefix is $[p\pm-]$.

3.1.9. Determiner agreements (cf. PS rules 1.17, 1.21, and section 2.2.3).

T3.1.9. [+D]
$$\cap$$
 NP[X \cap $\begin{bmatrix} \beta Animate \\ \gamma Human \end{bmatrix}$] \Rightarrow δ Person ϵ 1st Person

See sections 4.10 through 4.18 for more on Determiners.

3.1.10. Agreement of possessive prefixes and adverbial possessive prefixes.

T3.1.10.
$$\begin{bmatrix} ^{+N}_{\alpha Plural} \\ \beta Person \\ \gamma lstPerson \end{bmatrix} - \underline{Gen} - \# - \begin{bmatrix} ^{+Pos}_{+AdvPos} \end{bmatrix} \Rightarrow$$

$$\begin{bmatrix} ^{+N}_{\alpha Plural} \\ \beta Person \\ \gamma lstPerson \end{bmatrix} - \underline{Gen} - \# - \begin{bmatrix} ^{+Pos}_{+AdvPos} \\ \alpha Plural \\ \beta Person \\ \gamma lstPerson \end{bmatrix}$$

Thus, possessive prefixes and adverbial possessive prefixes agree with the preceding Noun regarding features of number and person. Most interestingly, however, there seems to be no transformation of the sort

$$(3.1.10a) *NomP[Nom...Nom] \land \underline{Gen} \land \# \land \begin{bmatrix} +Pos \\ +AdvPos \end{bmatrix} \Rightarrow$$

$$\alpha Plural \Rightarrow$$

$$NomP[Nom...Nom] \land \underline{Gen} \land \# \land \begin{bmatrix} +Pos \\ +AdvPos \\ +AdvPos \end{bmatrix}$$

such that a compound Nominal-Phrase whose last Noun is sinqular cooccurs with a singular agreement pattern, as in:

- (3.1.10b) 'ubihtim 'iyii miyik

 LONG-AGO-SHE-YOU STEAL-ACC YOUR-MOTHER-GEN

 mina'n pinu'.

 YOUR-FATHER-GEN FROM-HIM

 'Long ago she stole you from your mother and father.'
- 3.1.11. Subject-object agreement pattern.

(<u>3</u>)]

An example, with the subject marker (reordered by T6.25) indicated by Subject[...], is:

(3.1.11a) 'ačam qai Subject[č] mɨmai·hi ya:nɨm.

WE NOT WE YOUR-SON-ACC HAVE

'We don't have your son.'

T3.1.11b. NomP[Nom...Nom] \cap PredP \cap Aux[X \cap $\begin{bmatrix} +Subject \\ \alpha Plural \end{bmatrix} \cap Y] \Rightarrow$

An example with compound subject is:

(3.1.11b) niyi' nina' kwin- Subject[-i] 'i:p

MY-MOTHER MY-FATHER QUOT THEY HERE

qaç.

DWELL

'My mother and father are said to live here.'

T3.1.11c. NomP[Nom...Nom[
$$X \sim \begin{bmatrix} \alpha Person \\ \beta lst Person \end{bmatrix}$$
] \(Y \cap [+Subject]

$$\Rightarrow$$
 NomP[Nom...Nom[X $\sim \begin{bmatrix} \alpha Person \\ \beta lstPerson \end{bmatrix}$] $\sim Y \sim$

where NomP is immediately dominated by VblP

An example with compound object is:

(3.1.11c) 'ubiht m- Object[-i] qwq:n nina'ni

LONG-AGO THEY THEM KILL MY-FATHER-ACC

nita:hi.

MY-UNCLE-ACCUSATIVE

'Long ago they killed my father and uncle.'

T3.1.11d. NomP[X
$$\sim \begin{bmatrix} \alpha Plural \\ \beta Person \\ \gamma lst Person \end{bmatrix}$$
] $\sim Y \sim [+Subject] (Past) (?) \Rightarrow$

where NomP is immediately dominated by VblP

An example is:

(3.1.11d) ni 'ayi' bi- Object[-n] ni: hak wup mimi'kin.

MY-HEAD IT ME ME-ACC VERY HURT

'My head is hurting me a great deal.'

T3.1.11e. NomP[
$$\left\{\begin{array}{c} X \cap [+Plural] \\ Nom...Nom \end{array}\right\}$$
] $\cap Y \cap \left[\begin{array}{c} +Segment \\ -Plural \\ +1stPerson \end{array}\right]$ (Past) (?)

where NomP is immediately dominated by VblP

The non-segmental plural marker is later (5.5) specified as length imposed on the preceding vowel. An example involving the additional plural object marker is:

- (3.1.11e) yara:'kčunai bin- Object[-i] .

 MAKE-WHITE-BENEFACTIVE-ACC HE-ME THEM

 'He made them white for me.'
- 3.1.12. Spread of Accusative case, Genitive case, and adverbial suffixes. In the following transformations, Case = yo# (Accusative), Gen (Genitive), or Adv_{TS}.

T3.1.12a.
$$VblP[X (NomP)^n Y \land Aux_V[Z \land \underline{ya\#}]] \Rightarrow$$

$$VblP[X (NomP - \underline{ya\#})^n Y - Aux_V[Z - \underline{ya\#}]]$$

An example (identical with (1.11a)) is:

qai k^win hami hi:ti maqai.
NOT QUOT WHO-ACC WHAT-ACC GIVE-ACC
'She didn't give anybody anything.'

T3.1.12b. NomP[((Conj) Nom)ⁿ]
$$\sim$$
 Case \Rightarrow
NomP[((Conj) Nom \sim Case)ⁿ]

where both NomP and Case are immediately dominated by the same node

For examples, where Case = \underline{y} = \underline{y} , see (3.1.11c); where Case = \underline{Gen} , see (3.1.10b). There is no example where Case = \underline{Adv}_{TS} .

T3.1.12c. Nom[X (DP) NP] \frown Case \Rightarrow

Nom[X (DP ~ Case) NP ~ Case]

where Nom and Case are immediately dominated by the same node

For examples, where Case = \underline{y} , see (1.17d); where Case = \underline{Gen} , see (1.18b); where Case = \underline{Adv}_{mS} , see (1.21b).

T3.1.12d. $DP[X (D) D] \cap Case \Rightarrow DP[X (D \cap Case) D \cap Case]$

where DP and Case are immediately dominated by the same node

For examples, where Case = Adv_{TS} , see (1.21b-d); where Case = \underline{y} 0#, see (3.1.12c) below. There is no example where Case = \underline{Gen} .

- (3.1.12c) mia tab± 'u:' 'amai y±:ça'ti

 MAY DUB-HE-PAST MARRY THAT-ACC WHICH-ONE-ACC

 DP[D[ham-] -i D[ib-] -i].

 WHO ACC THIS ACC

 'He may have married someone.'
- 3.1.13. Optional deletion of Accusative case with plural object.
- T3.1.13. [+Plural] $\gamma y = \pm + Plural$] $(y = \pm + Plural)$

It seems that the deletion allowed by this transformation does not take place when ambiguity would result. Compare (3.1.13a) with no Accusative case to mark the object and (3.1.13b) where without the Accusative case suffix the Sentence would be ambiguously either '...then they called the other people' or '...then the other people called them.'

- (3.1.13a) ...ani $k^W \pm n \pm b \pm ta: qtam k^W u: han$.

 AND-THEN QUOT-HE-THEM PEOPLE CALL

 '...and then he called the people.'
- (3.1.13b) ...ayai' kwinimi kwunhan an hwuwami

 THEN QUOT-THEY-THEM CALL THEY OTHER-ACC

 ta:qtami.

 PEOPLE-ACC
 '...then they called the other people.'

3.1.14. Deletion of Accusative case in Imperatives.

T3.1.14a.
$$\underline{y} \ni \# \cap \begin{bmatrix} +A \\ -B \end{bmatrix} \Rightarrow \begin{bmatrix} +A \\ -B \end{bmatrix}$$

$$\begin{bmatrix} +A \\ -B \end{bmatrix} = Imperative Aspect (2.5c)$$

An example is (1.14d), in which the Verb $\#k^Wa'a\#$ 'eat' occurs without $y \ni \#$ Accusative case. With $y \ni \#$, the Verb would have the form $[k^Wa'i]$.

T3.1.14b.
$$Pred[X \cap \underline{y \ni \#} \cap Y] \cap \begin{bmatrix} +A \\ -B \end{bmatrix} \cap Z \Rightarrow Pred[X \cap Y] \cap \begin{bmatrix} +A \\ -B \end{bmatrix} \cap Z$$

An example is (1.11c).

T3.1.14c. Pred[
$$X \sim y \ni \# \sim Y$$
] $\sim \begin{bmatrix} +A \\ -B \end{bmatrix} \sim \#q\acute{a}y \# \Rightarrow$

$$Pred[X (yə#) Y] \sim \begin{bmatrix} +A \\ -B \end{bmatrix} \sim #qáy#$$

Two Sentences demonstrating the optional nature of the deletion of Accusative case in negative Imperatives occur in the following example.

- (3.1.14a) "qai ç kwa' 'amai moč. tam

 NOT YOU EAT THAT-ACC AGAIN DUB-SHE-YOU

 ra:kwinia'nib. qai ç kwa' hwončqa:hçič 'ama

 FEED-FUTURE NOT YOU EAT FILTHY-STUFF THAT

 'ani m maqai," qii kwin piyika'.

 THEN SHE-YOU GIVE-ACC SAY-ACC QUOT TO-HIM

 '"Don't eat that any more! She'll feed you.

 Don't eat that filthy stuff when she gives it
 to you!" she said to him.'
- 3.1.15. Deletion of Accusative case in nominalizations, adverbializations.

T3.1.15. Pred[$X \cap \underline{y} \ni \underline{y} \cap Y \Rightarrow X \cap Y$

where Y = N or Adv_{TS} , and the phonological representation of Y does not begin with #

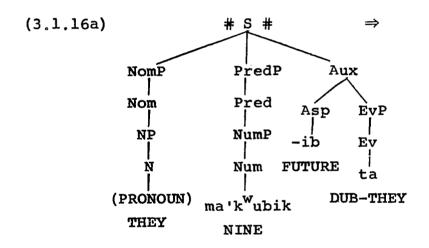

Thus, there is no Accusative case after the Verb in examples like (3.2.1c-k), (3.2.4b-c), (3.2.7a).

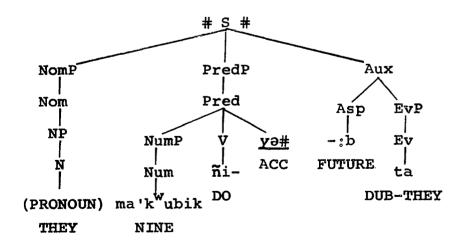

3.1.16. Introduction of the Verb #Miha:# 'do' (cf. section 1.3, examples (1.3b-c)).

T3.1.16. Pred
$$\left\{\begin{array}{c} NomP \\ NumP \\ X \cap AdjP \end{array}\right\}$$

where Y is either an $\mathrm{Adv}_{\mathrm{TS}}$, as in (1.8g), or some member of the category Aspect whose phonological representation is non-null

An example is:

ma'k^Wubik ta ñi:b.
'There will be nine of them.'

- 3.1.17. Deletion of ? in Sentences having question-words (cf. section 1.4.5.2).
- T3.1.17. [-Determinate] $\cap X \cap \underline{?} \Rightarrow [-Determinate] \cap X$

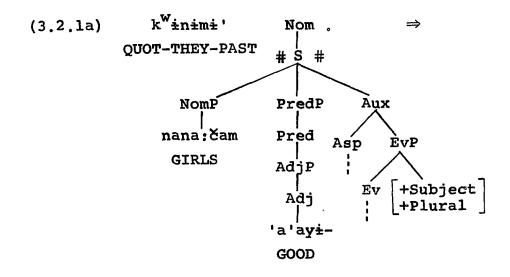

For an example, see (1.4h).

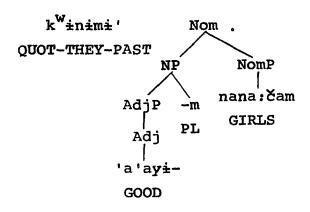

- 3.2. Embedding transformations.
- 3.2.1. Noun plus modifier from embedded Sentence (cf. PS rule 1.17, example (1.17e)).
- T3.2.la. Nom[#S[NomP[X] \sim Pred[Y (\underline{y})] \sim Aux[Z \sim [+Subject]]

#]
$$\Rightarrow$$
 Nom[NP[Y \sim [+Segment]] \sim X]

where Y ≠ NomP

An example is:

'They were good girls.'

- T3.2.la accounts for the agreement of the number affixes between Nouns and their modifiers from the Predicates of embedded Sentences, as in the following examples:
- (3.2.1b) pay±ka' t±:buka 'a:p Adj['ati‡'a-] -ç hwukah-t

 AWAY DOWNWARD THERE BIG SG DEER-SG

qaç.

BE

'Way down there is a big deer,'

- (3.2.1c) 'a:p kwin ama' kwu-t TS['ubia], V[i:m'-]

 THERE QUOT IT FIRE-SG ALREADY END

 PunctP[-q-] -c.

 PUNCTUAL SINGULAR

 'There it was an already-ended fire.'
- (3.2.1d) ama TS['i:piu'-] -c na: St kwin ča:cu'.

 THE FROM-HERE SG GIRL QUOT SING

 'The girl on this side sang.'

(For further clarification of (3.2.1d), see 3.2.2.)

If the modifier is a Noun, however, it has inherent number, that is, the sign for Plural is fixed, and al-

though, for obvious semantic reasons, this sign is usually the same as the sign for Plural of the Noun modified, as in (3.2.le-f), it is not necessarily so, as in (3.2.lg), where [yua:qaiam] 'Chemehuevis' (see 2.1.3) modifies [točiñt]

'youth'.

(3.2.le) N[nana: čam] N[houpi 'iam] ni ya: nim 'i:p.

GIRLS LITTLE-CHILDREN I-THEM HAVE HERE

'I had the little girls [up] here.'

- (3.2.1f) ...ani kwin ama' N[čičint] N['añi;'či]

 AND-THEN QUOT THE BOY SMALL-ONE
 'a:p miy.

 THERE GO
 '...and then the younger boy went there.'
- (3.2.1g) 'ama' kwinibi' pi;čiba' pičii

 THE QUOT-HE-PAST WITH-THEM ARRIVE

 N[yua:qaia-m] N[točin-t].

 CHEMEHUEVI-PLURAL YOUTH-SINGULAR

 'The Chemehuevi youth came with them.'

The modification pattern illustrated in examples (3.2.1d-e-f) is accounted for by the following transformation.

T3.2.1b. Nom[$\#S[NomP[X] \cap Pred[Y] \cap Aux]\#] \Rightarrow Nom[Y \cap X]$

where Y ends in [+N]

The modifiers from both T3.2.la and T3.2.lb are described as preceding the Nouns modified, even though in actually occurring Sentences there are about as many examples of following as of preceding modifiers. The preceding modifier is posited at this stage so that the agreement patterns can be read out of the Noun head of the construction, as, for example, in T3.1.4 or T3.1.11. Consider the modifying Noun #Mu:# 'possession', as in (3.2.lh-i):

- (3.2.1h) pu:nu paxa: wi: 'n.

 THEIR-POSSESSION CEREMONIAL-CLOWN SHOUT

 'Their ceremonial clown shouted.'
- (3.2.1i) amai miči' maqai čañui

 THAT-ACC THEY-US GIVE-ACC OUR-POSSESSION-ACC

 ŋiçqati,

 BEADS-ACC

 'They gave us those beads of ours.'

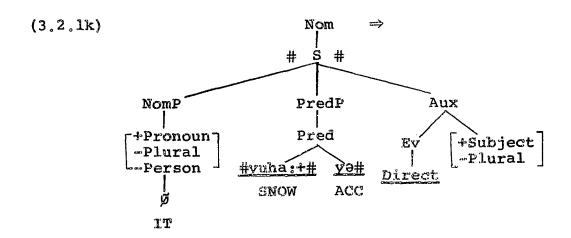

It would be guite inconvenient to have to suppose that #Mu: # might have two different lexical specifications, one [+Human] as when it occurs in [pu: nu paxa: '] 'their ceremonial clown', and the other [-Animate], as when it occurs in ['amai čaffui nicqati] 'those beads of ours (Acc)', just when this difference in lexical specification is that between the Nouns modified by #nu:#. Thus, a Noun modifier construction, such as in (3,2,1f), is described as being a stylistic reordering of an underlying modifier \ Noun. This possible stylistic reordering means there can be some ambiquities. Such an example is (3.2.1e), which is ambiguously a reordering of [houpi'iam nana; cam] 'little girls' (as it is treated in the gloss for the Sentence) or a non-reordered construction which would be glossed something like 'little girl children'.

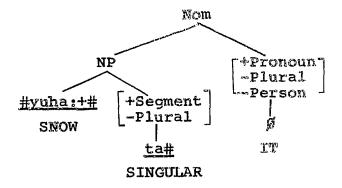

"Weather" Verbs, such as #yuha:+# 'snow', #wo:na+#

'rain', like their semantically corresponding forms in English, usually cooccur with non-plural, non-person pronominal subjects, as in (3.2.1j). The Nouns corresponding to

(3.2.1j) yui bi'.
SNOW-ACC IT-PAST
'It snowed.'

these Verbs, [yua:t] 'snow', [wo:nt] 'rain', can be accounted for by reference to T3.2.la. For example:

yua:t 'snow'

On the other hand, it may be that #yuha:+#, #wo:na+# should be lexically specified as both [+V] and [+N].

3.2.2. Deletion of the Verb #qaçə# 'be' from Predicate embedded in Nominal.

T3.2.2. TS $\uparrow \frac{\text{#qa}}{\text{qe}} \Rightarrow$ TS

where TS, $\frac{\#gac_{2}\#}{}$ are immediately dominated by NP

An example is:

- (3.2.2a) NP[TS['i:piu'-] #qaçə# -ç] NomP['ama' na:št]

 FROM-HERE BE SG THE GIRL

 kwin ča·çu'. ⇒

 QUOT SING

 NP[TS['i:piu'-]-ç] NomP['ama' na:št] kwin ča:çu'.

 ama 'i:piu'ç na:št kwin ča:çu'.

 THE FROM-HERE-SG GIRL QUOT SING

 'The girl on this side sang.'
- 3.2.3. Nominalizations involving [-Agree w/subject] Nouns (cf. section 2.1.8).

$$\begin{bmatrix} +N \\ -Agree \text{ w/subject} \end{bmatrix} \Rightarrow NP[X \sim \begin{bmatrix} +N \\ -Agree \text{ w/subject} \end{bmatrix}]$$

where each immediate constituent of PredP ends in [+V]

Examples (3.2.3b-c) involve the embedded Sentence (3.2.3a).

The Accusative case is deleted by T3,1,15; the singular suffix is added by T4.5.

(3.2.3c) #'o:sana# i# ['o:san- -i- -č]

WRITE RESULTATIVE SG

NOMINAL

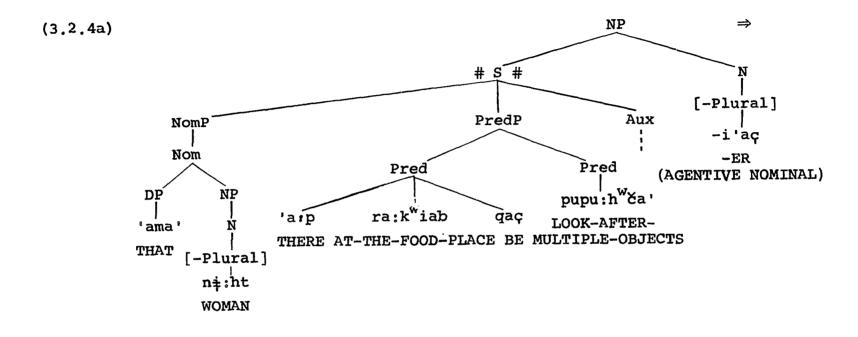

'something written (i.e., book, letter, etc.)'

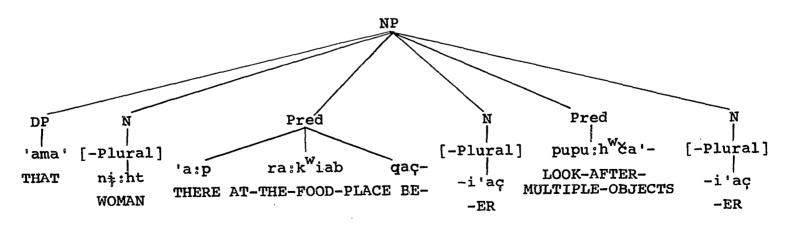

- 3.2.4. Nominalizations involving [+Agree w/subject] Nouns.

where each immediate constituent of PredP ends in [+V]

T3.2.4b. $NP[X (Pred)^n N] \Rightarrow NP[X (Pred \cap N)^n]$

T3.2.4b is more properly an agreement transformation, but it is included here rather than in section 3.1 for reasons of clarity. An example illustrative of T3.2.4a-b is:

As in:

- (3.2.4b) n‡:ht 'ama 'a:p ra:kwiab qaçi'aç

 WOMAN THAT THERE AT-THE-FOOD-PLACE BE-ER

 pupu:hwča'i'aç bɨnɨ' pičɨi

 ONE-WHO-LOOKS-AFTER- SHE-ME-PAST ARRIVE

 MULTIPLE-OBJECTS

 'The dining room matron came to me'
- 3.2.5. Possessed nominalizations.
- T3.2.5a. NomP[NP[NomP[X] \sim #S[NomP[X] \sim Pred[Y (AdjP) V \sim Z] \sim Aux[A \sim EvP[B \sim [+Subject] \sim C]]]# \sim N[+N]]] \Rightarrow

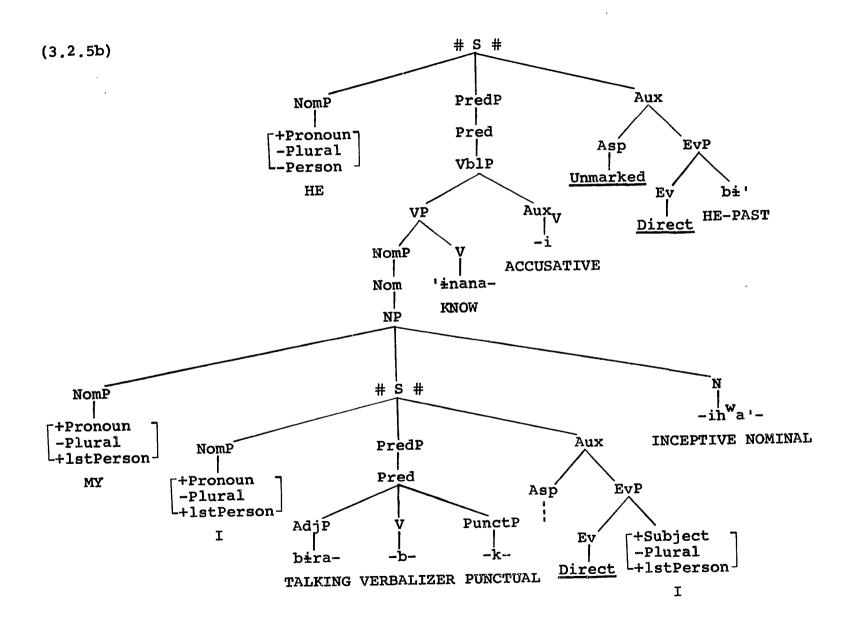

The following examples illustrate each of the above possibilities.

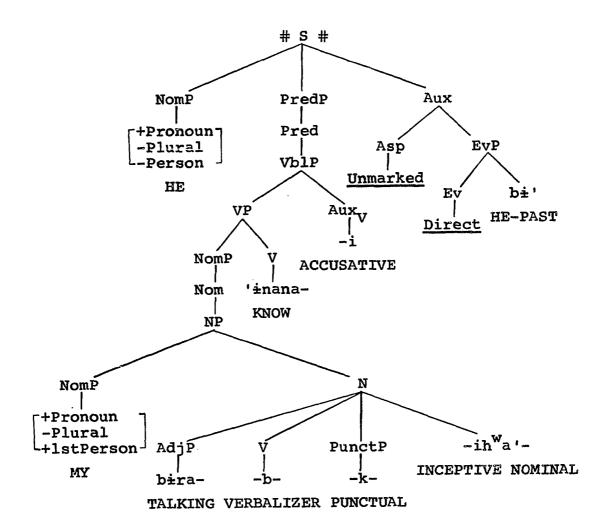

wi'winai bin nimipi'kçi.
WANT-ACC HE-ME MY-SWALLOWING-IT-ACC

'He wants me to swallow it (verbatim: he wants me my swallowing it).'

'inanai bi' nibirabkih a'çi.

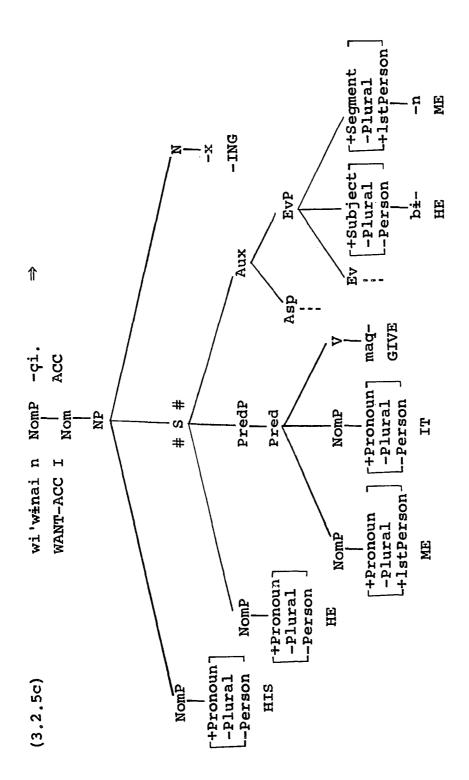

KNOW-ACC HE-PAST MY-GOING-TO-TALK-ACC
'He knew I was going to talk.'

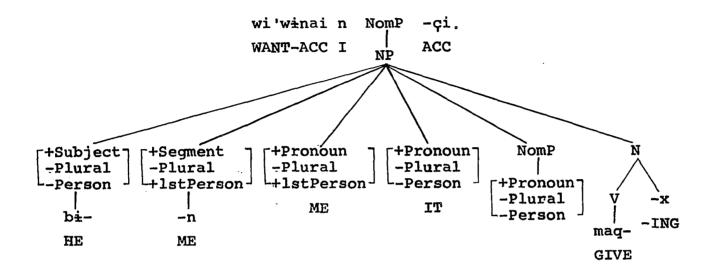

T3.2.5b. NomP[NP[NomP[X]
$$\sim$$
 #S[NomP[X] \sim Pred[Y (AdjP) V \sim Z]
$$\sim_{\text{Aux}} \left[A \sim_{\text{EvP}} \left[B \sim_{\text{CFeature}}^{\text{+Subject}} C \right] \right] \# \sim_{\text{N}} \left[+N \right] \} \Rightarrow$$

$$N[(AdjP) V \cap Z \cap [+N]]]$$

where C is non-null and does not contain

Of the two possibilities to the right of the double arrow for T3.2.5b, there are no clear examples of the first, but both possibilities are posited to parallel those of T3.2.5a. The following is an example illustrating the second possibility above.

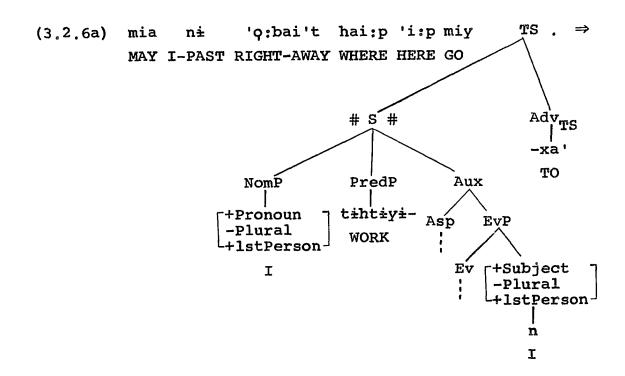

wi'winai n bin amaqxçi.
WANT-ACC I HE-ME HIS-GIVING-ACC
'I want him to give it to me.'

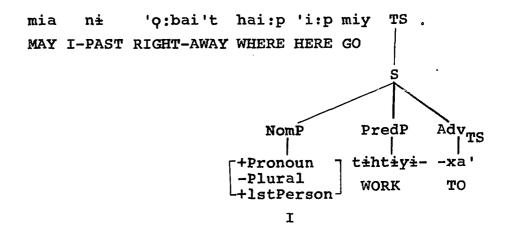

3.2.6. Time-Space adverbials involving embedded Sentences (cf. PS rule 1.8, example (1.8g)).

T3.2.6a.
$$\#S[X \cap Aux[Y \cap [+Subject] \cap Z]]\# \cap Adv_{TS} \Rightarrow$$

$$S[X \cap Adv_{TS}]$$

An example is:

mia ni 'q:bai't hai:p 'i:p miy tihtiyixa'.

MAY I-PAST RIGHT-AWAY WHERE HERE GO TO-WORK

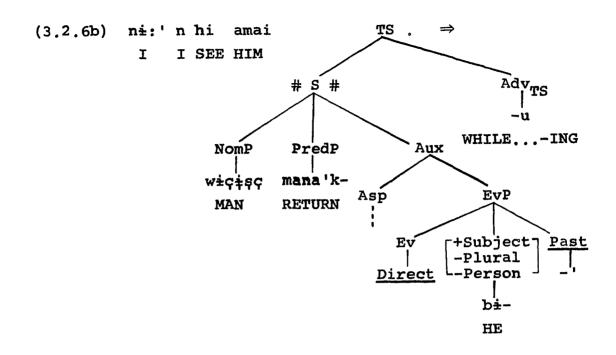

'I presumably went somewhere right away to work.'

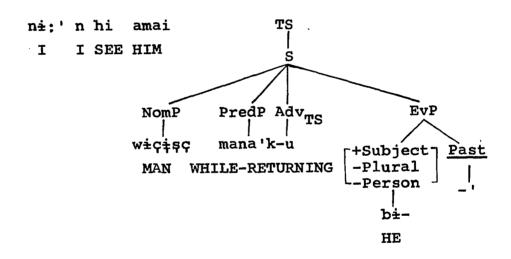

T3.2.6b.
$$\#S[X \cap Aux[Y \cap EvP[Z \cap [+Subject] \cap A]]]\# \cap Adv_{TS} \Rightarrow$$

$$S[X \cap Adv_{TS} \cap EvP[[+Subject] \cap A]]$$

where A is non-null and does not contain ?

An example is:

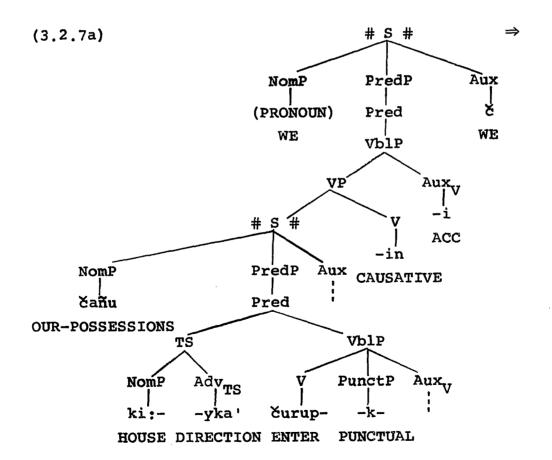

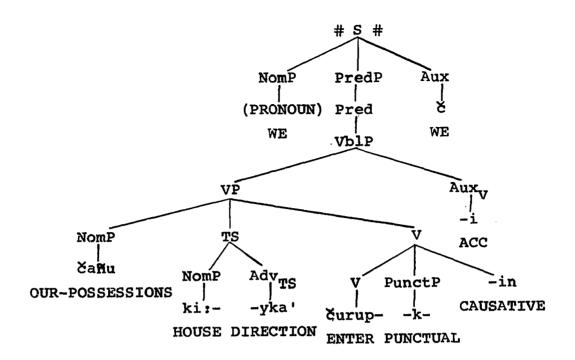

n±:' n hi amai w±ç‡şç b±' mana'ku.
I I SEE HIM MAN HE-PAST WHILE-RETURNING
'While the man was going home I saw him.'

3.2.7. Verbalization of embedded Sentences: Causative (cf. PS rule 1.12, example (1.12g)).

T3.2.7. $VP[\#S[X \cap Vb1P[(AdjP) \lor (PunctP)] \cap Y]\# \cap V[Z]] \Rightarrow$

As a result of this transformation, the entire complex (AdjP) V (PunctP) Z, of which Z is the Causative suffix, is dominated by V; that is, the complex as a whole is a Verb stem in the matrix Sentence. An example is:

čanui č ki:yka' čurupkin.

OUR-POSSESSIONS-ACC WE HOUSE-DIRECTION ENTER-CAUSATIVE

'We took our things in the house.'

3.2.8. Embedded Sentences in Manner adverbials: direct quotations.

T3.2.8.
$$\#S[X \cap Manner[Y \cap \underline{"..."}] \cap Z] \# \Rightarrow$$

This transformation accounts for the fact that direct quotations follow or precede the remainder of the Sentence

containing them, and that further, the material inside a direct quotation is not subject to any adjustments with regard to the structure of the Sentence in which it was originally embedded, and the structure of the Sentence associated with the direct quotation is unaffected by that of the direct quotation. Each of the possibilities specified above is illustrated by the following examples, found successively in a text.

- (3.2.8a) 'ubia čɨmɨ' wiha:hq amai qai:či
 ALREADY WE-PAST GO-AROUND THAT-ACC HILL-ACC

 'ani n qɨi. "mitkinan mọa:'ti
 AND-THEN I SAY-ACC IT-SEEMS-LIKE-I SMOKE-ACC

 hwukwum."

 SMELL
 - 'We went around that hill and I said, "It seems like I smell smoke."
- (3.2.8b) "ibi 'ama'" qi bi'.

 THIS IT SAY-ACC SHE-PAST

 '"This is it," she said.'

An exception to this rule is found in the case of citation forms, as exemplified in the following example.

- (3.2.8c) "'atiwan bi' ama' John Thomas" qii m

 HIS-NAME IT-PAST THE SAY-ACC THEY

 yang 'ačamič "ka:pa'" qii.

 BUT WE-WE SAY-ACC
 - 'They say his name was John Thomas, but we called him "Ka:pa'" (verbatim: "His name was John Thomas," they say but we "Ka:pa'" sai(d)).'
- 3.2.9. Other embedded Sentences in Manner adverbials.
- T3.2.9. $\#S[X \cap NomP[Y] \cap Z \cap Manner[\#S[NomP[Y] \cap Pred[A \cap V \cap B] \# \cap \underline{nqV\#}] \cap C] \# \Rightarrow$

 $\#S[X \cap NomP[Y] \cap Z \cap Manner[A \cap V \cap \underline{nqV\#}] \cap C]\#$

This transformation refers to the specific Adverb of manner ngV# 'so doing', inasmuch as this is the only Adverb of manner so far identified, other than "..." (3.2.8), which is positively specified for the contextual feature [#S#] (see 2.13). An example illustrative of T3.2.9 is:

tukanq amai wɨçɨsçi 'awočahabti kwɨn ya:'.

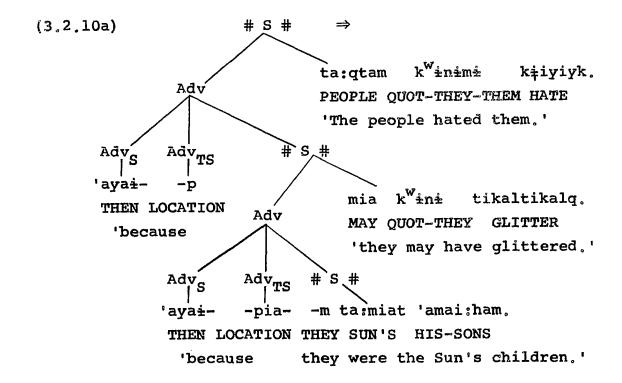

PACKING THE-ACC MAN-ACC HER-HUSBAND-ACC QUOT TAKE

'Carrying the man, her husband, on her back, she took him.'

3.2.10. Embedded Sentences in Sentence adverbials (cf. PS rule 1.7, example (1.7b)).

T3.2.10.
$$S[Adv[X^{+}S^{+}]^{Y}] \Rightarrow \begin{cases} \#[X^{S}]^{+} \cap S[Y] \\ S[Y]^{-}\#[X^{S}]^{+} \end{cases}$$

Thus, the internal structure of Sentence adverbials involving embedded Sentences and that of the remainder of the Sentence containing such a Sentence adverbial are mutually independent. For an example of the first possibility, namely, $\#[X\cap S]\#\cap S[Y]$, see (1.7b). Two instances of the second possibility, namely, $S[Y]\cap \#[X\cap S]\#$, occur in (3.2. 10a), where one Sentence adverbial is embedded in the other.

S[ta:qtam kwinimi kiiyiyk], #['ayaip mia kwinit tikaltikalq]#, #['ayaipiam ta:miat 'amai:ham]#.

'The people hated them, maybe because they glittered, because they were the Sun's children.'

3.2.11. Deletion of identical structure in disjunctively coordinated Sentences: Constructions involving #ha:# 'or' (cf. section 1.1.2).

T3.2.11.
$$S[A \cap B \cap C] # \cap \frac{\#ha:\#}{} \cap S[A \cap D \cap C] # \Rightarrow OR$$

where the phonological representations of A, B, C, D all begin and end in #, and B \neq D.

An example is:

(3.2.11a) #S[S[mia t čičint]# ha S[mia t na:št]#]# ⇒
MAY DUB BOY OR MAY DUB GIRL

#S[mia t čičint ha na:št]#

MAY DUB BOY OR GIRL

'Maybe it's a boy or a girl.'

4. PRE-MORPHOLOGICAL ADJUSTMENTS

4.0. The transformations of this section, and of subsequent sections, apply to a Phrase-marker only if neither that Phrase-marker nor any symbol dominating that Phrasemarker is found in $X[Y^{+}_{-} + Z]$, where $X \neq S$. This is to say, these transformations apply only after all embedding transformations (3.2) have been applied.

The agreements effected by the rules of section 3.1, as well as a few other factors, must be adjusted somewhat before non-lexically introduced material can be related to phonological form (section 5). The rules of the present section apply exclusively to specific syntactic formatives and features.

4.1. Deletion of [α Plural] of Nouns with adverbial or verbal suffixes.

4.1.
$$\begin{bmatrix} +N \\ \alpha Plural \end{bmatrix} \sim X \Rightarrow [+N] \sim X$$

where X is the phonological representation of a [+Adv $_{TS}$], a [+Adv $_{manner}$], or a [+V], and X does not begin with \pm

For examples of Nouns with following Adverbs of time-space,

Adverbs of manner, and Verbs, showing the non-occurrence of number suffixes in that position, see (1.8a-b-d), (1.9b), (1.12d), (2.1g-ee).

4.2. Absolutive suffix (cf. section 2.1.7).

T4.2.
$$NP[\begin{bmatrix} +N \\ +Absolutive \end{bmatrix}] \Rightarrow NP[[+N] \cap [+Absolutive]]$$

4.3. Non-occurrence of singular suffix with [-SgSuffix] Nouns (cf. section 2.1.6).

4.4. Plural suffix on Nouns and on [-A] Aspects.

T4.4a.
$$\begin{bmatrix} +N \\ +Plural \end{bmatrix}$$
 ([+Absolutive]) \Rightarrow

Examples are:

T4.4b. Asp[[-A]] (Ev)ⁿ
$$\begin{bmatrix} +Subject \\ +Plural \end{bmatrix} \Rightarrow$$

Asp[[-A]
$$\sim$$
 [+Segment]] (Ev) n [+Subject]
$$\frac{m \pm \#}{n}$$

Examples are:

- (4.4b) kwini hwukahti mikana-qa- -m.
 QUOT-THEY DEER-ACC KILL-GOING-TO-PLURAL
 'They're going to kill a deer.'
- (4.4c) 'ubia m k^Wu:man-i- -m.

 ALREADY THEY SLEEP-COMPLETIVE-PLURAL

 'They've already slept.'
- 4.5. Singular suffix with Nouns and with Completive Aspect.

T4.5a.
$$\begin{bmatrix} +N \\ -Plural \end{bmatrix} \Rightarrow [+N] \sim \begin{bmatrix} +Segment \\ -Plural \end{bmatrix}$$

Examples are:

(4.5a) #wanó+# \(\frac{ta#}{ta#}\) [wan±t] 'river'

#məhá:# \(\frac{ta#}{ta#}\) [m±a;\(\cappa\)] 'moon'

#hó:mi# \(\tat{ta#}\) [h\(\frac{w}{\cappa}\);mč] 'witch doctor'

T4.5b.
$$Asp\left[\begin{bmatrix} -A \\ -C \end{bmatrix}\right]$$
 (Ev)ⁿ $\begin{bmatrix} +Subject \\ -Plural \end{bmatrix} \Rightarrow$

$$Asp\begin{bmatrix} -A \\ -C \end{bmatrix} \smallfrown \begin{bmatrix} +Segment \\ -Plural \end{bmatrix} \end{bmatrix} (Ev)^n \begin{bmatrix} +Subject \\ -Plural \end{bmatrix}$$

An example is:

- (4.5b) 'ubia k^wu:man-i- -t
 ALREADY SLEEP-COMPLETIVE-SINGULAR
 'He has already slept.'
- 4.6. Deletion of the singular suffix.

T4.6.
$$NP[X \sim \begin{bmatrix} +Segment \\ -Plural \end{bmatrix}] \sim Y \Rightarrow NP[X] \sim Y$$

where Y \neq yə# (Accusative) or Gen (Genitive), and X either begins with NomP

or ends with some phonological representation which ends in a consonant other than $\underline{\mathbf{h}}$

T4.5-6 provide for singular suffixes on non-plural Nouns except as provided in T4.1-2-3-4 and except for the non-case forms of possessed Nouns and Nouns which end in consonants other than \underline{h} . Examples are:

Here may be the explanation of why, with few exceptions, vowel-final Spanish loanwords in Serrano acquire an added ____. In this fashion they do not have any singular suffix except in case forms. Examples are:

(4.6b)	Spanish	Non-case form	Accusative case form	
	acha	'a:ča'	'a:ča'ti	'axe'
	durazno	rura:sna'	rura:sna'ti	'peach'
	la mesa	lame:sa'	lame:sa'ti	'table'

The exceptions include three words where the final vowel of the Spanish original is lost:

and [na:wt] 'dress' (< nagua) morphophonemically #ná:wa+# \ta#. What seems to have happened in this case is rather involved. Probably the possessed form, [-na:wa'], was the one borrowed. This would be morphophonemically interpreted as #na:wá#, from which the non-possessed form #ná:wa+# was analogically created in accordance with the patterns specified in section 6.13.

4.7. Possessive prefixes on Nouns.

T4.7a.
$$\begin{bmatrix} +Pos \\ -Plural \\ +Person \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ -Plural \\ +Person \end{bmatrix}$$

The first person plural possessive prefix is usually the [+Det] form, $\underline{\check{c}a\#}$ (5.1), but one occurrence of the [+Segment] form, $\underline{\check{c}\&\#}$ (5.2), was observed:

(4.7a) č‡kąbay±m' nu:man. (Louie Marcus)

OUR-KNIFE-ACC-YOU BREAK

'You broke our knives.'

T4.7d.
$$\begin{bmatrix} +Pos \\ +Flural \\ -lstPerson \end{bmatrix} \Rightarrow \begin{bmatrix} +Det \\ -lstPerson \end{bmatrix} \cap \begin{bmatrix} -Segment \\ +Plural \end{bmatrix}$$

4.8. Merger of [+Person] adverbial possessive prefixes with corresponding Determiners.

T4.8.
$$\begin{bmatrix} +AdvPos \\ +Person \end{bmatrix} \Rightarrow \begin{bmatrix} +D \\ +Person \end{bmatrix}$$

4.9. Third person adverbial possessive prefixes.

T4.9a.
$$\begin{bmatrix} +AdvPos \\ +Plural \\ -Person \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ -Person \end{bmatrix} - \begin{bmatrix} +Segment \\ +Plural \end{bmatrix}$$

$$\frac{\#p \dot{z} \#}{}$$

T4.9b.
$$\begin{bmatrix} +AdvPos \\ -Plural \\ -Person \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ -Person \end{bmatrix}$$
 $\frac{\#p^{\frac{1}{2}\#}}{}$

4.10. Analysis of singular [+Person] Determiners.

T4.10a.
$$\begin{bmatrix} +D \\ -Plural \\ +lstPerson \end{bmatrix} \Rightarrow \# \begin{bmatrix} +Segment \\ -Plural \\ +lstPerson \end{bmatrix} \cap \begin{bmatrix} +Det \\ -Person \end{bmatrix}$$

$$\underline{n} \ni \#$$

The introduction of # in T4.10a guarantees that $n\ni\#^hV^+\#$ $[n\div:']$ 'I' is preceded by a word boundary.

T4.10b.
$$\begin{bmatrix} +D \\ -Plural \\ -lstPerson \end{bmatrix} \Rightarrow \begin{bmatrix} +Det \\ -lstPerson \end{bmatrix} \land \begin{bmatrix} +Segment \\ -Plural \\ -lstPerson \end{bmatrix} \land \\ \frac{\#'9\#}{}$$

<u>hV+#</u> is later shifted to <u>i'#</u> (T6.14) when not followed by Accusative or Adv_{TS}, giving [' \pm mi'] 'you singular'.

4.11. The second person plural Determiner object and adverbial forms.

T4.11.
$$\begin{bmatrix} +D \\ +Plural \\ -1stPerson \end{bmatrix} \begin{Bmatrix} Adv_{TS} \\ X \cap V \end{Bmatrix} \Rightarrow$$

Examples with Adv_{TS} are:

An example involving #'ə# mə# :# ['imi] as object is:

- (4.11b) 'imi biči' k^Wu:haničun.
 YOU-PLURAL HE-US CALL-BENEFACTIVE
 'He called you for us.'
- 4.12. The second person plural Determiner elsewhere.

T4.12.
$$\begin{bmatrix} +D \\ +Plural \\ -1stPerson \end{bmatrix} \Rightarrow$$

An example involving #'ə# \hv+# \mi# ['i:m] 'you plural' is:

- (4.12a) 'im ta:qtam tam ç ŋirirkib.
 YOU-PLURAL PEOPLE DUB-PLURAL YOU MOVE-FUTURE
 'You Indians move!'
- See 0.1 for the use of [ta:qtam] 'people' for 'Indians' and 4.25 for the use of the Future for plural commands.
- 4.13. The first person plural Determiner.

T4.13.
$$\begin{bmatrix} +D \\ +Plural \\ +lstPerson \end{bmatrix} \Rightarrow$$

The first person plural Determiner is the [-Proximate]
['ačam] in Sarah Martin's speech, but is the [+Proximate]
['ičam] in Louie Marcus's.

4.14. Plural suffix on plural -[__[+Person]] Determiners.

T4.14.
$$\begin{bmatrix} +D \\ -[_[+Person]] \end{bmatrix} \Rightarrow \begin{bmatrix} +D \\ -[_[+Person]] \end{bmatrix} \land \begin{bmatrix} +Segment \\ +Plural \end{bmatrix}$$

$$\frac{m \dot{z} \#}{2}$$

Examples are:

4.15. -[__[+Person]] Determiners with following Adverb of time-space or plural suffix.

T4.15.
$$\begin{bmatrix} +D \\ -[_[+Person]] \\ (\alpha Plural) \\ \beta Feature \end{bmatrix} \begin{cases} +Segment \\ +Plural \\ Adv_{TS} \end{bmatrix} \Rightarrow$$

$$\begin{bmatrix} + Segment \\ \beta Feature \end{bmatrix} \smallfrown \begin{bmatrix} + Det \\ - Person \end{bmatrix} \begin{cases} \begin{bmatrix} + Segment \\ + Plural \end{bmatrix} \\ Adv_{TS} \end{bmatrix}$$

By T4.15 the -[__[+Person]] Determiners with following Adverbs of time-space are identical with those occurring with plural suffixes. Examples illustrative of this include, for the [+Proximate] #'i#\[hV+# ['i:-], (2.21a), (2.21b-d); for the [-Proximate] #'a#\[hV+# ['a:-], (1.4n), (1.2b); for the [-Determinate] #hahi#\[hV+# [hai:-], (1.4q), (1.4h).

4.16. Singular suffix on the indeterminate Determiner #hi:+# 'what'.

The following examples illustrate that $\frac{\#hi:+\#}{\#hi:+\#}$ cooccurs with both $\begin{bmatrix} +Animate \\ -Human \end{bmatrix}$ and [-Animate] Nouns.

- (4.16a) pibeipa' mimai:r, miña, mikan, hi:ti,

 IF YOUR-SON YOUR-RELATIVE KILL WHAT-ACC

 hwukahti, hwui:'ti, amai imi' qai m' kwa'i.

 DEER-ACC JACKRABBIT-ACC IT-ACC YOU NOT YOU EAT-ACC

 'If your son, [or] your relative, killed something,

 [like] a deer [or] a jackrabbit, you didn't eat

 it.'
- (4.16b) qai & hai:pa'n hi:ti pişei'ti k^wa'i.

 NOT WE EVER WHAT-ACC SWEET-ACC EAT-ACC

 'We never ate anything sweet.'
- 4.17. Singular suffix on Genitive case forms of -[__[+Person]] Determiners.

T4.17.
$$\begin{bmatrix} -D \\ -[+Person] \end{bmatrix} (\underline{Gen}) \Rightarrow \alpha Feature$$

Only with the Genitive case do the above Determiners have singular suffixes. (Stress is placed on the non-case forms below by T6.19.)

4.18. Merger of non-first person plural object markers.

T4.18.
$$\begin{bmatrix} +Segment \\ +Plural \\ -Person \\ -lstPerson \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ +Plural \end{bmatrix}$$

Second person plural object markers are not differentiated from third person plural markers. Note how the presence of the Determiners ['imi] 'you plural' and ['a:mi-] 'them' alone serves to differentiate the following examples.

- (4.18a) 'imi ni hihi.
 YOU-PL I-PL SEE.
 'I see you plural.'
- (4.18b) 'a:m±n± hihi.
 THEM-I-PL SEE
 'I see them.'
- 4.19. Merger of second and third person objects of first person subject.

T4.19.
$$\begin{bmatrix} +Subject \\ +Person \end{bmatrix} \cap \begin{bmatrix} +Segment \\ -1stPerson \end{bmatrix} \Rightarrow \begin{bmatrix} +Subject \\ +Person \end{bmatrix} \cap \begin{bmatrix} +Segment \\ -Person \end{bmatrix}$$

The resulting non-person, non-plural object marker is in turn deleted, by T4.20.

4.20. Deletion of non-person, non-plural object marker.

This results in potential ambiguity, as in (4.20a).

(4.20a) tan (Ø) mɨpɨˈkinib.

DUB-I YOU/IT SWALLOW-FUTURE

'I'll swallow you/it.'

Further, there is no morphological difference between third person singular object (or certain instances of second person singular object) and no object at all. Compare (1.4e) and (1.4h). The subject-object agreement marker in both cases is [-b±'], but in (1.4e) there is a third person singular object, [čičinti] 'boy (Acc)', while in (1.4h) there is no object.

4.21. The third person plural object marker form with second person subject.

An example, with the second person plural subject marker restructured by T4.27a-b, is:

(4.21a) qai pɨmɨ ç maːç hiːti.

NOT THEM-PLURAL YOU LISTEN WHAT-ACC

'You don't listen to anything they say (verbatim: you don't listen to them anything).'

4.22. Deletion of third person subject markers with second person singular object.

T4.22.
$$\begin{bmatrix} +Subject \\ -Person \end{bmatrix} \cap \begin{bmatrix} +Segment \\ -1stPerson \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ -1stPerson \end{bmatrix}$$

$$\frac{m \ni \#}{}$$

Third person singular or plural subject is unmarked when the object is second person person singular. When the object is second person plural, third person subjects are distinguished, the second person plural object marker having been merged with the third person plural object marker by T4.18. The following examples illustrate the morphological ambiguity resulting from T4.22. In these examples, the proper gloss is determined by context.

- (4.22a) ta- (Ø) -m k^Wu:hanib.

 DUB SHE YOU CALL-FUTURE

 'She'll call you.'
- (4.22b) ta- (Ø) -m ti‡hai ?

 DUB THEY YOU TELL-ACC QUESTION

 'Did they tell you?'
- 4.23. Deletion of third person singular subject marker.

T4.23.
$$\begin{bmatrix} +Subject \\ -Plural \\ -Person \end{bmatrix}$$
 (?) # \Rightarrow (?) #

Third person singular subject is unmarked in the absence of any following object marker and Past tense, as in (1.14j-k). Elsewhere, third person singular subject is marked by $b \pm \#$ (5.3).

4.24. First person singular object of second person singular subject.

4.25. Deletion of [αPlural] of subject in Imperatives.

T4.25.
$$\begin{bmatrix} +A \\ -B \end{bmatrix} \sim X \sim \begin{bmatrix} +Subject \\ \alpha Plural \\ -lstPerson \end{bmatrix} \Rightarrow \begin{bmatrix} +A \\ -B \end{bmatrix} \sim X \sim \begin{bmatrix} +Subject \\ -lstPerson \end{bmatrix}$$

Number of second person subject is not distinguished with Imperative Aspect. The following examples apply equally to 'you singular' and 'you plural'.

- (4.25a) pa:'.
 'Drink!'
- (4.25b) qai ç pa:'.

 NOT YOU DRINK
 'Don't drink!'
- (4.25c) k^w±' c p± yo:'o ?

 POTENTIAL YOU THEM DRY-IMPERATIVE QUESTION

 'Could you dry them?'
- T4.22 results in potential ambiguity. Consequently, in making commands intended specifically for 'you plural' as opposed to 'you singular', the second person plural Future form is often used, as in:
- (4.25d) qai tam ç pai: 'b.

 NOT DUB-PL YOU DRINK-FUTURE

 'Don't drink (you plural)!/You plural won't drink.'
- 4.26. Optional deletion of second person subject marker with Direct Imperative.

T4.26.
$$\begin{bmatrix} +A \\ -B \end{bmatrix}$$
 $\sim \underline{\text{Direct}} \sim \begin{bmatrix} +\text{Subject} \\ -1\text{stPerson} \end{bmatrix} \Rightarrow$

$$\begin{bmatrix} +A \\ -B \end{bmatrix} \smallfrown \underline{\text{Direct}} \quad (\begin{bmatrix} +\text{Subject} \\ -1\text{stPerson} \end{bmatrix})$$

Compare (1.4b), in which the second person subject is marked by [c], with:

- (4.26a) Čurupq Asp[Ø] Ev[Ø] Ø.

 GO-IN-PUNCTUAL IMPERATIVE DIRECT YOU

 'GO in!'
- 4.27. Second person plural subject marker adjustments.

For an example, see (4.21a).

An example is:

(The boundary between $\frac{\#q\acute{a}y\#}{}$ 'not' and $\frac{m\dot{z}\#}{}$ 'plural' is introduced in 6.1.)

4.28. First person plural object of third person subject.

For an example, see (1.15a).

4.29. First person plural subject with the Volitative Evidential #na'a# 'let's'.

where
$$X \neq [+Plural]$$

The following pair of Sentences illustrates the optional nature of the subject-object marker with the Volitative Evidential.

With plural object, the marker is the same as with other Evidentials: <u>Či#~mi#~:#</u> [Čimi], accounted for by T4.30a and T4.32c. An example is:

- (4.29b) na' Čimi xal^Ya'.

 LET'S WE-THEM TICKLE

 'Let's tickle them!'
- 4.30. Other first person plural subject-object markers.

T4.30a.
$$\begin{bmatrix} +Subject \\ +Segment \end{bmatrix} -X (?) \Rightarrow \\ +1stPerson \end{bmatrix}$$

where X is non-null

For examples, see (1.4s), (1.10a), (4.29b).

T4.30b.
$$\begin{bmatrix} +Subject \\ +Plural \\ +lstPerson \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ +Plural \\ +lstPerson \end{bmatrix}$$

$$\frac{\check{C}i\#}{}$$

For examples, see (1.7c), (1.12i).

4.31. First person singular and third person plural subjects.

T4.31a.
$$\begin{bmatrix} +Subject \\ -Plural \\ +lstPerson \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ -Plural \\ +lstPerson \end{bmatrix}$$

$$\frac{n3\#}{}$$

For examples, see (0.3a), (1.6e-i).

T4.31b.
$$\begin{bmatrix} +Subject \\ +Plural \\ -Person \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ +Plural \end{bmatrix}$$

$$\frac{m \div \#}{2}$$

For examples, see (1.6b-g-h-j-k-n).

4.32. Non-segmental plural marker after [+M] Evidentials. The arbitrary symbol M is chosen for the feature differentiating #ha# Inferential, #k^Wənə# Quotative, #pata# Intensive, and #ta# Dubitative, all of which are [+M], from the other Evidentials listed in (2.6b), which are [-M].

T4.32a. [+M]
$$\sim$$
 [+Segment] (?) # \Rightarrow [+M] \sim [-Segment] (?) #

where F is null

The non-segmental plural marker, symbolized :# (5.5), is length imposed on the preceding vowel, which length blocks the deletion of that vowel in word-final position (7.9), after which the vowel length itself is reduced (7.49). Examples of plural subjects with [+M] Evidentials are:

(4,32a) t Xa 'inan atiwani.

DUB INFERENTIAL-PLURAL KNOW HIS-NAME-ACCUSATIVE

'They must have known his name.'

- (4.32b) k^{W} ini 'a:p ra: k^{W} .

 QUOTATIVE-PLURAL THERE EAT

 'They ate there.'
- (4.32c) ...yanq mitkin paça 'a'ay±m.

 BUT IT-SEEMS-LIKE INTENSIVE-PLURAL GOOD-ONES

 '...but it seems like they're such good [people].'
- (4.32d) ta şi:'b.

 DUBITATIVE-PLURAL BLOOM-FUTURE

 'They'll bloom.'
- 4.33. Non-segmental plural marker in other positions.

T4.33a. [-Person]
$$\sim$$
 [+Segment] $\sim X \Rightarrow$

where X is not [+Plural]

An example is #pi# \: # [pi] 'them', as in:

(4.33a) k^w±' ç p± 'iču'kčun.

CAN YOU THEM MAKE-BENEFACTIVE
'You could make it for them.'

T4.33b.
$$\begin{bmatrix} +Segment \\ +Plural \end{bmatrix} \land \begin{bmatrix} +Segment \\ +Plural \end{bmatrix} \Rightarrow \begin{bmatrix} +Segment \\ +Plural \end{bmatrix} \land \begin{bmatrix} -Segment \\ +Plural \end{bmatrix}$$

$$\frac{m \pm \#}{2} \qquad \frac{\#}{2}$$

where F is null

- (4.33b) qai čimi ç ma:ç.

 NOT US-PLURAL YOU LISTEN

 'You plural don't listen to us.'
- 4.34. Deletion of second person singular subject.

T4.34.
$$\begin{bmatrix} +Subject \\ -Plural \\ -1stPerson \end{bmatrix} \begin{Bmatrix} X & (Past) & (?) \end{Bmatrix} \Rightarrow \begin{Bmatrix} X & (Past) & (?) \end{Bmatrix}$$

where X is non-null

The deletion of second person singular subject before marked object is illustrated by (4.34a). Compare this

(4.34a) ta- Ø -pi tijhib.

DUB (YOU) THEM TELL-FUTURE

'You'll tell them.'

with (4.34b), where the object is unmarked (cf. T4.20).

(4.34b) ta-m' ti‡hib.

DUB-YOU TELL-FUTURE

'You'll tell him.'

Possible ambiguity results from the deletion of the second person singular subject in non-past questions, as in (4.34c).

(4.34c) ti:'ai t ?

ROAST-ACC DUB QUESTION

'Are you roasting it? / Is she roasting it?'

This ambiguity may be resolved by the inclusion of the appropriate Determiner, as in (4.34d-e).

- (4.34d) ti:'ai t ? 'imi'.

 ROAST-ACC DUB QUESTION YOU

 'Are you roasting it?'
- (4.34e) ti: 'ai t ? 'ama'.

 ROAST-ACC DUB QUESTION SHE

 'Is she roasting it?'

5. MORPHOLOGY

5.0. In this section phonological material is related to syntactic material introduced other than lexically. In this presentation, the symbol → is to be understood as meaning that the phonological material to the right is associated with the syntactic material to the left. A statement of this sort is referred to as a "morphological" rule.

Ideally, no phonological material would be introduced in the phrase-structure rules and all grammatical formatives would be associated with appropriate phonological representation in this section. For reasons of convenience, various phonological representations have been introduced in the PS rules, but for completeness, the following morphological rules should be included:

(5.0a)	$\underline{Dubitative} \stackrel{\text{m}}{\rightarrow} \underline{\#ta\#}$	(< 1.4)
(5.0b)	$\underbrace{\text{Question}} \stackrel{\text{m}}{\rightarrow} \underline{?}$	(< 1.4)
(5.0c)	Accusative \xrightarrow{m} yə#	(< 1.8, 1.11)
(5.0d)	$\underline{\text{Motion}} \stackrel{\text{m}}{\rightarrow} \underline{\text{cu'a\#}}$	(< 1.11)
(5.0e)	Resultative \xrightarrow{m} $\underline{\mathbf{i}} \cdot \underline{\mathbf{i}} + \underline{\mathbf{j}}$	(< 1.14)
(5,0f)	Punctual → go#	(< 1.14)

5.1. Phonological forms of Determiners (Det).

(5.1a)
$$\begin{bmatrix} +Det \\ +Plural \\ +lstPerson \end{bmatrix} \xrightarrow{m} \underbrace{\check{c}a\#}$$
 'we, us, our'

(5.1b)
$$\begin{bmatrix} +Det \\ -1stPerson \end{bmatrix} \xrightarrow{m} \frac{\#'e\#}{}$$
 'you, your'

(5.1c)
$$\begin{bmatrix} +Det \\ -Person \end{bmatrix} \xrightarrow{m} \underline{hV+\#}$$

(5.1d)
$$\begin{bmatrix} +Det \\ +Proximate \end{bmatrix} \xrightarrow{m} \frac{\#'ibi\#}{}$$
 'this'

(5.1e)
$$\begin{bmatrix} +Det \\ -Proximate \end{bmatrix} \xrightarrow{m} \frac{\#'ama'\#}{\#}$$
 'that, he, she, it, ...'

(5.1f)
$$\begin{bmatrix} +Det \\ -Determinate \end{bmatrix} \xrightarrow{m} \frac{\#hami\#}{}$$
 'who, someone, anyone'

(5.lg)
$$\begin{bmatrix} +Det \\ -Determinate \end{bmatrix} \xrightarrow{m} \frac{\#hi:+\#}{\#hi:+\#}$$

5.2. Phonological forms of "Segments."

(5.2a)
$$\begin{bmatrix} +Segment \\ +Plural \\ +lstPerson \end{bmatrix} \xrightarrow{m} \check{c}i\# 'we, us'$$

(5.2b)
$$\begin{bmatrix} +Segment \\ -Plural \\ +1stPerson \end{bmatrix} \xrightarrow{m} \underbrace{n \ni \#} 'I, me, my'$$

(5.2c)
$$\begin{bmatrix} +Segment \\ -Plural \end{bmatrix} \xrightarrow{m} \underline{m} + you, your'$$

(5.2d)
$$\begin{bmatrix} +Segment \\ +Plural \end{bmatrix} \xrightarrow{m} \frac{m \pm \#}{}$$
 'they, them, their, plural'

(5.2e)
$$\begin{bmatrix} +Segment \\ -Plural \end{bmatrix} \xrightarrow{m} \underline{ta\#}$$
 'singular'

(5.2f)
$$\begin{bmatrix} +Segment \\ -Person \end{bmatrix} \xrightarrow{m} \frac{\#p \pm \#}{}$$
 'him, his, them, their'

(5.2g)
$$\begin{bmatrix} +Segment \\ +Proximate \end{bmatrix} \xrightarrow{m} \frac{\#'i\#}{}$$

(5.2h)
$$\begin{bmatrix} +Segment \\ -Proximate \end{bmatrix} \xrightarrow{m} #'a#$$

5.3. Phonological forms of "Subjects."

(5.3a)
$$\begin{bmatrix} +Subject \\ -Plural \\ -lstPerson \end{bmatrix} \xrightarrow{m} \underline{m'\#}$$

(5.3b)
$$\begin{bmatrix} +Subject \\ -1stPerson \end{bmatrix} \xrightarrow{m} \frac{\#q \ni \#}{}$$

(5.3c)
$$\begin{bmatrix} +Subject \\ -Plural \end{bmatrix} \xrightarrow{m} \underline{b} \pm \#$$

The first person object marker.

(5.4a)
$$\begin{bmatrix} +\text{Object} \\ +\text{1stPerson} \end{bmatrix} \xrightarrow{m} \underbrace{\text{``i'}\#}$$

5.5. The non-segmental plural marker.

(5.5a)
$$\begin{bmatrix} -Segment \\ +Plural \end{bmatrix} \xrightarrow{m} | +Tense | #$$

The preceding vowel is made long (7.2). $|+\text{Tense}| \pm \text{ is symbolized}$ alphabetically as $\pm \pm \text{.}$ (See 6.0 for the distinctive features of Serrano.)

5.6. Past tense.

(5.6a) Past
$$\stackrel{\text{m}}{\rightarrow}$$
 +Stressed $| \#$

The preceding vowel is stressed (7.3). |+Stressed | # is symbolized alphabetically as _#. The phonetic result of (5.6a) is that when the subject-object marker involved ends in a short vowel, the Past tense form ends in that vowel

followed by a glottal stop (cf. rule 7.31 and many examples of Past tense throughout). If, however, the subject-object marker ends in a long vowel, that is, when its last part is $\begin{bmatrix} -\text{Segment} \\ +\text{Plural} \end{bmatrix}$ (5.5a), then the Past:non-past opposition is neutralized (7.48). Also, when the last segment of the subject-object marker is not a vowel, as in the case of $\underbrace{\text{Ci'}\#}$ (5.4a) and $\underline{\text{m'}\#}$ (5.3a), the Past:non-past opposition is neutralized as well (7.4).

5.7. Reflexive.

(5.7a) Reflexive ^m #táqa+#

The Reflexive #tága+# is very similar in form to the Noun #tá:qa+# 'person', and the two words are probably related etymologically, but no way to relate them syntactically in the contemporary language has been found.

5.8. Genitive case.

(5.8a) Gen $\stackrel{\text{m}}{\rightarrow}$ $\frac{\pm(1)\#}{2}$

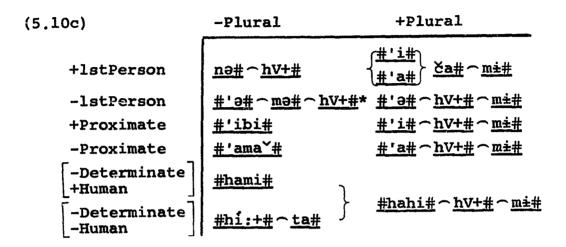

(') is a notation indicating that the preceding vowel may or may not be stressed. An example is:

- 5.9. Absolutive suffix (cf. section 2.1.7).
- (5.9a) [+Absolutive] $\stackrel{\text{m}}{\rightarrow}$ ta#
- 5.10. Some illustrative paradigms. Much of the output of sections 4 and 5 can be displayed in tabular form as follows.
- 5.10.1. The possessive prefixes.

5.10.2. The adverbial possessive prefixes.

*#pi# 'him, her, it' is later (T6.2) adjusted to #pi# na# before vowels.

5.10.3. The Determiners.

*#'\text{\text{mo#} no# not followed by Accusative case or Adverb of time-space.

5.10.4. The subject-object agreement patterns. There are no [alstPerson] objects of [alstPerson] subjects because of the reflexivization transformation (T3.1.2).

5.10.4.1. In the case of first person subjects, second and third person object markers merge (T4.19).

5.10.4.2. Second person subjects.

(5.10e)		you si	ngular	you plural				
	me	<u> </u>		<u> </u>				
	us	(*)		#69# ~ #: ~ #£m ~ #£3				
	(him)	(<u>#çə#</u>)	~ <u>m'#</u>	<u>#€9#</u>				
	them	(<u>#çə#</u>)	~ <u>m'#</u> #p i # ^ :#	#69#~#: ~# <i>±m</i> ~# <i>±</i> q#				

*No clear example involving 'you singular-us' was collected.

5.10.4.3. Third person subjects.

(5.10f)		he	they
	me	<u>b±</u> # ^ <u>n</u> #	<u>m±</u> # ~ <u>n</u> ə#
	me-them	b <u>i</u> # nə# n :#	<u>m±#~nə#~:#</u>
	us	<u>b±</u> # ~ <u>či'</u> #	<u>mi#~どi'#</u>
	you singular	<u>#6m</u>	# 6 m
	you plural	#: ~ #em	#: ~ #em
	(him)	(<u>b±#</u>)*	mi# ~ :#**
	them	b±# ~ :#	<u>m≥# ^ :#</u>

*bi# cooccurs with Past; otherwise 'he(-him)' is zero.

**:# cooccurs with [+M] Evidentials with no Past tense

(4.32).

6. POST-MORPHOLOGICAL TRANSFORMATIONS

6.0. This section includes late restructurings and reorderings, including mention of stylistic reordering, and transformations whose effects are almost entirely phonological.

The boundary between the transformations of the present section and the phonological rules of section 7 is somewhat difficult to draw. This suggests there may be a useful distinction to be made between the base component (sections 1 and 2), which specifies deep structure, and all the remainder of the operations, including phonological rules, which map deep structure into surface form (sections 3 through 7).

The rules of this section, as well as those of section 7, assume an underlying morphophonemic system represented by an alphabet consisting of the boundaries #, ±, and the segments defined by a distinctive feature scheme as specified first in the tree diagrams (6.0b-c) and then somewhat more fully (including a number of redundant specifications) in the tables (6.0d-e). No attempt is made here to distinguish between redundant and non-redundant features in the rules.

The following are abbreviations for distinctive features:

(6.0a) Seg = Segment Gra = GraveVoc = Vocalic Fla = Flat

Nas = Nasal

Con = Consonantal Int = Interrupted

Lat = Lateral

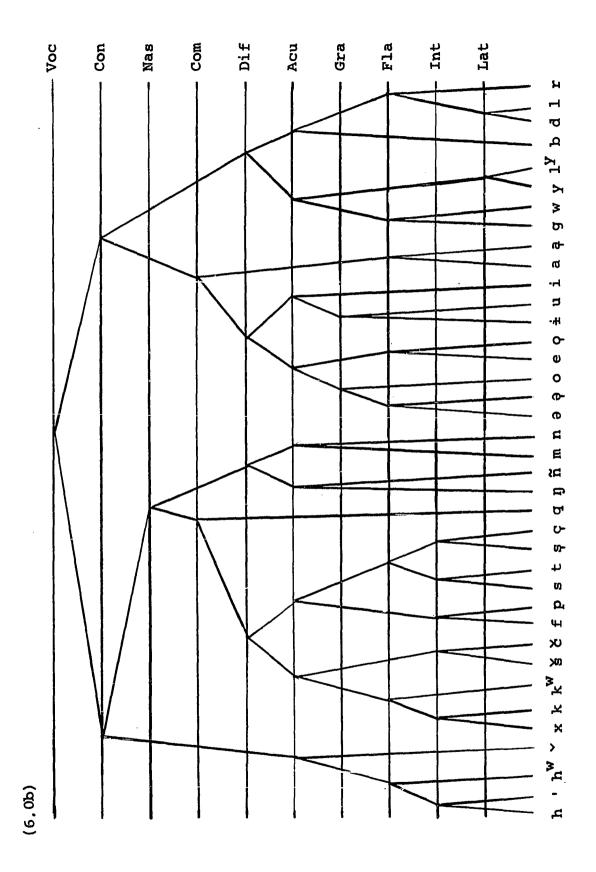

Com = Compact Ten = Tense

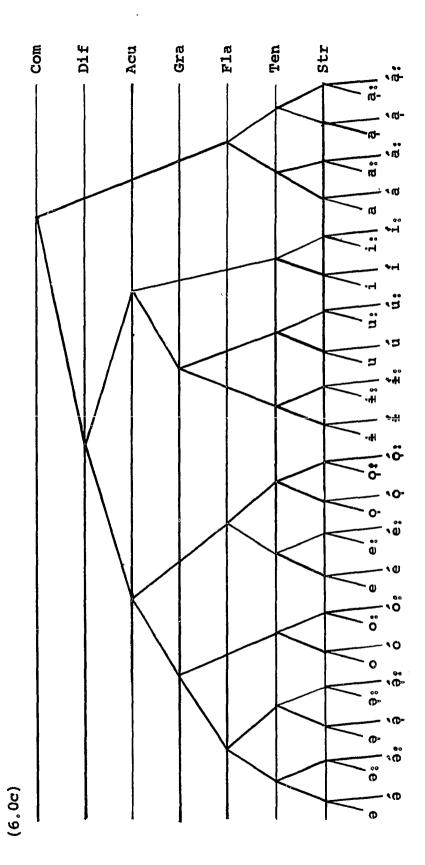

Dif = Diffuse Str = Stressed

Acu = Acute Fea = Feature

This presentation is unusual in distinguishing the feature Lateral, which differentiates $\underline{1}$ from \underline{d} , and $\underline{1}^{\underline{Y}}$ from \underline{Y} .

"Feature" is used to refer to all features of a segment not otherwise mentioned, as, for example, in T6.9.

6.1. Word boundary adjustments with subject-object markers.

T6.1a. $[-M] \cap X \Rightarrow [-M] (\#) X$

where X is a non-null phonological representation which does not begin with # or ?

(For [±M] Evidentials, see 4.32.) T6.la allows for the fact that certain subject-object markers may or may not be suffixed to preceding material. Compare ['ačam č], below, which has the # introduced by T6.la, with the syntactically identical ['ačamɨč] in (3.2.8c), which lacks the word boundary.

(6.1a) 'ačam Ø č harupq.

WE DIRECT WE GET-DOWN

'We got down.'

T6.1b. $X \cap \# \cap [+Segment] \Rightarrow X \cap [+Segment]$

where X <u>#</u> is the phonological representation of a [+M] Evidential

An example is:

as in (4.33a).

6.2. Introduction of <u>na#</u> in third person singular adverbial possessive prefix.

T6.2.
$$\begin{bmatrix} +Segment \\ -Person \end{bmatrix} \cap \begin{vmatrix} +Voc \\ -Con \end{vmatrix} \Rightarrow \begin{bmatrix} +Segment \\ -Person \end{bmatrix} \cap \underbrace{\frac{+Voc}{-Con}}$$

#pi#

Examples (with the first person singular forms for comparison) are:

6.3. Past tense questions with second person singular subject.

T6.3.
$$\#$$
 | +Dif | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$ | $\#$

| -Dif |
$$\beta$$
Fea | # α Fea | -Plural | -1stPerson | α Fea | α

In questions with second person singular subject, <u>Past</u> is absorbed into the Dubitative Evidential with modification of the initial \underline{t} of $\underline{\#ta\#}$ to $\underline{\&}$, as in (6.3a). Note that \underline{t}

(6.3a) 'imi' ča-m' pa:'i ?
YOU DUB-PAST-YOU DRINK-ACC QUESTION
'Did you singular drink?

remains with plural subject, as in (6.3b), and with nonpast, as in (6.3c).

- (6.3b) 'im ta-m qi-' pa:'i ?
 YOU-PL DUB-PL YOU-PAST DRINK-ACC QUESTION
 'Did you plural drink?
- (6.3c) ta-m' pai:'b.

 DUB-YOU DRINK-FUTURE

 'You singular will drink.'

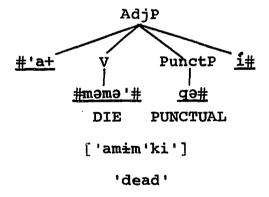

6.4. Discontinuous representations of lexical items.

T6.4.
$$X[Y \cap Z[\underline{A,..B}]] \Rightarrow X[\underline{A} \cap Y \cap \underline{B}]$$

where A...B is the phonological representation of some member of the category Z, and Y and Z are both immediately dominated by X

Examples are:

(as in 1.13d)

(6.4b) Manner
$$\Rightarrow$$
 Manner $\#$ S $\#$ S $\#$ Adv manner $\#$ S $\#$ S $\#$ S $\#$ S $\#$ C (2.13h) (2.13i) $\#$ (2.13h) (2.13i)

(as in (2.13d-e-g))

6.5. The incorporation of post-verbal material into the Verb stem and the destruction of the Verbal-Phrase and Verbal Auxiliary nodes.

T6.5.
$$Vblp[X \cap V[Y \cap [+V]] \cap Z] \cap Aux_V[(Freq) A \cap \underline{ya\#}] \Rightarrow$$

$$X \cap V[Y (Freq) [+V] \cap Z \cap A] \cap y \ni \#$$

This material must be dominated by V for T6.6. For examples of Frequentatives found before Verbs, see 2.14.

6.6. The reordering of Accusative case and Aspect and the destruction of the Auxiliary and Predicate nodes.

T6.6a.
$$Pred[W \cap V[X] \cap \underline{y \ni \#}] \cap Aux[Asp[[+A] \cap Y] \cap Z] \Rightarrow$$

$$W \cap V[X \cap Asp[[+A] \cap Y] \cap y \Rightarrow \#$$

Future Aspect, which is [+A] (see section 2.5.3), must be

dominated by V for the operation of T6.26b-c; but $\underline{\alpha}\underline{\hat{a}}\#$ Going-to and $\underline{i}+\#$ Completive, which are [-A], are not dominated by V, as is specified below.

T6.6b. Pred[$X \sim y \ni \#$] $\wedge Aux[[-A] \sim Y] \Rightarrow X \cap [-A] \cap y \ni \# \cap Y$ An example is:

- (6.6a) Pred[#miha:# \(\frac{y\text{9#}}{y\text{9#}}\) \(\text{Aux}[\frac{q\data}{q\data}\) \(\text{Direct} \cdot \psi \cdot \neq \n\text{1}\)

 \[
 \text{#miha:# \(\frac{q\data}{q\data}\) \(\frac{y\text{9#}}{y\text{0irect}}\) \(\psi \n\text{n\text{9#}}\)

 \[
 \text{GO GOING-TO ACC I }

 \]

 [mia:qai n] 'I'm going to go.'
- 6.7. Substitution of wona# for <u>i'i#</u> qo# (Resultative Punctual) with the Verbs #čonu'# and #čonon# 'stand, stop'.

T6.7.
$$\left\{ \begin{array}{c} \frac{\#\bullet \circ nu'\#}{\#\bullet \circ n\circ n\#} \end{array} \right\} \stackrel{\underline{i}'\underline{i}\#}{=} \circ q \ni \# \Rightarrow \left\{ \begin{array}{c} \frac{\#\bullet \circ nu'\#}{\#\bullet \circ n\circ n\#} \end{array} \right\} \stackrel{\underline{w}\ni na\#}{=}$$

Examples are:

(6.7a) 'ama' wɨçɨşç ka:pa' čonu'wɨn.

THAT MAN STAND-RESULTATIVE

'That man Ka:pa' was standing (there).'

- (6.7b) 'a:pia & ἄσρορwɨn.

 THERE WE STAND-RESULTATIVE

 'There we stood.'
- 6.8. Deletion of qo# Punctual and ina# Causative.

T6.8a. PunctP[X
$$\sim$$
 gə#] (ina#) [+A \rightarrow PunctP[X] PUNCTUAL CAUSATIVE PERFECTIVE

Examples are $[m \pm m \pm ']$ 'dead' and $[m \pm n \pm ']$ 'swallowed', as in (2.5d).

Presumably the perfective forms of other than Q-class Verbs should be accounted for at this point, but the patterns appear to be quite irregular and there are so few examples that the subject is abandoned with their mention in section 2.5.5.

T6.8c. <u>qə#</u> <u>aba#</u> <u>ina#</u> ⇒ <u>aba#</u> PUNCTUAL ITERATIVE CAUSATIVE ITERATIVE For discussion and examples for T6.8b-c, see 2.14.4.

6.9. Metathesis in Q-class Verbs (1.12.1) and the destruction of the Punctual-Phrase node (cf. section 1.14.1).

T6.9.
$$\begin{vmatrix} +\text{Voc} \\ \alpha \text{Ten} \\ +\text{Str} \\ \beta \text{Fea} \end{vmatrix} = \begin{vmatrix} +\text{Voc} \\ -\text{Ten} \\ -\text{Str} \\ \gamma \text{Fea} \end{vmatrix} = \frac{\# \cap \text{PunctP}[X]}{\# \cap \text{PunctP}[X]} \Rightarrow$$

Examples are:

(6.9a) #bi:+ru# qə# ⇒ #biú:+r# qə# [biu:rq] 'roll up'

#čó;či# qə# ⇒ #čoi·č# qə# [čoi:čq] 'shrivel'

#pi+ti# i'i# qə# ⇒ #pii+t# i'i# qə# [piti'q]

'it's full (Resultative)'

#qá+tu# i'i# qə# ⇒ #qaú+t# i'i# qə#

[qwoutu'q] 'it's cut (Resultative)'

6.10. Deletion of the first of a pair of vowels in sequence with intervening #.

where if either α or β = +, then δ = +

Examples are:

(6.10a)
$$\#q\acute{o}\# \ ib\# \ yo\# \Rightarrow \#q \ ib\# \ yo\# \ [kibi] 'say (Fu-SAY FUTURE ACC SAY-FUTURE ACC ture)'
$$\#m\acute{o}: \ 'a+\# \ ib\# \Rightarrow \#m\acute{o}: \ ' \circ ib\# \ [moi: 'b] \ 'smoke (Fu-SMOKE FUTURE SMOKE FUTURE ture)'$$$$

6.11. Restructuring of possessive prefixes.

T6.11.
$$NP[NomP \cap \underline{Gen} \cap X \cap \underline{\#} \cap Y] \Rightarrow NP[NomP \cap \underline{Gen} \cap X \cap \underline{+} \cap Y]$$

where Y is dominated by N but $X \cap \#$ is not

Thus, the forms cited in (5.10a) are respecified as:

(6.11a) -Plural +Plural +1stPerson
$$n \rightarrow +1$$
 $\left\{\begin{array}{c} \underline{\check{c}a+} \\ \underline{\check{c}i+} \end{array}\right\}$ -1stPerson $m \rightarrow +1$ m

such that there is no word boundary (##) between the possessive prefix and the following Noun, and yet the steminitial consonant of the Noun remains unaffected by the various rules operating on postvocalic consonants.

6.12. Imperatives of Verbs of the shape $\frac{\#\text{Ci}}{h}$ $\left\{ \begin{array}{c} \cdot \\ \underline{h} \end{array} \right\}$ $\underline{\text{V}\#}$.

T6.12.
$$\#$$
 |+Seg |+Voc | -Voc |+Voc | $\# \cap [+A] \Rightarrow$ | +Dif |+Acu | α Ten | α Ten |

Examples are:

(6.12a)
$$\#\&i'a\# \land \begin{bmatrix} +A \\ -B \end{bmatrix} \Rightarrow \#\&i\acute{a}'\# [\&ia'] 'pick it up!'$$

$$\#pi:'a\# \land \begin{bmatrix} +A \\ -B \end{bmatrix} \Rightarrow \#pi\acute{a}:'\# [pia:'] 'throw it!'$$

$$\#\&iha:\# \land \begin{bmatrix} +A \\ -B \end{bmatrix} \Rightarrow \#\&i\acute{a}:h\# [\&ia] 'do it!'$$

$$\#hih\acute{a}\# \land \begin{bmatrix} +A \\ -B \end{bmatrix} \Rightarrow \#hi\acute{a}h\# [\&ia] 'look at it!'$$

6.13. Restructuring possessed Nouns. Possessed forms of Nouns seem best describable as derived from the non-possessed forms, rather than the other way around.

T6.13a.
$$X \sim \begin{vmatrix} +Voc \\ -Con \end{vmatrix} = \begin{cases} \frac{\checkmark}{\pm} \\ \pm \end{cases} = X \sim \begin{vmatrix} +Voc \\ -Con \end{vmatrix} = X \sim Y$$

where $X \sim \begin{vmatrix} +Voc \\ -Con \end{vmatrix} = \begin{cases} \frac{\checkmark}{\pm} \\ \pm \end{cases} = X \sim Y = Y$

representation of some [+N, +[NomP__],
...], and $Y \neq Adv_{TS}$

Examples are:

Note that the following is an exception to the deletion of \succeq , inasmuch as the preceding segment is a consonant.

T6.13b.
$$NP[X \cap Y \cap | +Ten | \cap Z \cap | +Voc | #] \Rightarrow$$

phonological representation of some
[+N, +[NomP__]]

Examples are:

T6.13d.
$$NP[X - \#(|+Seg|)| - Str| - Y - |+Str| - Z - A] \Rightarrow$$

$$NP[X - \#(|+Seg|)| + Str| - Y - |-Str| - Z - A]$$

An example is:

T6.13e. NP[NomP
$$\sim Gen \sim X \sim \# \mid +Seg \mid +Voc \mid \sim Y \mid \sim Z \Rightarrow$$

$$NP[NomP \sim Gen \sim X \sim \# \mid +Seg \mid +Voc \mid \sim Y \mid \sim Z$$

$$-Con \mid +Str \mid +S$$

(6.13g)
$$\frac{\#n\partial + ^{\prime}}{\#ku\#} \Rightarrow \frac{\#n\partial + ^{\prime}}{\#ku\#} [nik^{W}u']$$
 'my fire'
$$\frac{\#n\partial + ^{\prime}}{\#su:n\partial\#} \Rightarrow \frac{\#n\partial + ^{\prime}}{\#su:n\partial\#} [nisu:n^{W}]$$
'my (man's) daughter'

6.14. Adjustment of second person singular Determiner.

T6.14.
$$\begin{bmatrix} +Segment \\ -1stPerson \end{bmatrix} \smallfrown \begin{bmatrix} +Det \\ -Person \end{bmatrix} \begin{Bmatrix} \# \\ \# \end{Bmatrix} \Rightarrow \frac{hV+\#}{}$$

$$\begin{bmatrix} +Segment \\ -1stPerson \end{bmatrix} \smallfrown \frac{i'\#}{\#} \begin{Bmatrix} \# \\ \# \end{Bmatrix}$$

An example including $\#' \ni \# \cap m \ni \# \cap \underline{i'\#} [' \ni mi']$ is (0.3b).

6.15. Reduplication. A number of lexical items (see section 2.14.6 for many examples) and also the morphologically introduced hV+# (5.1c) are specified in terms of the symbols \underline{C} and \underline{V} rather than exclusively in terms of the alphabet or features described in section 6.0. Although the de-

tails have not yet been worked out, these symbols, \underline{C} and \underline{V} , are mapped into specific complexes of distinctive features by the rules of this section. Prefixed reduplication can be handled by a schema like T6.15a.

T6.15a.
$$\#CV(')(:)(\{\frac{\pm}{\underline{h}}\})| + \text{Seg} | + \text{Seg} | \Rightarrow$$

$$\# | + \text{Seg} | +$$

A number of examples are given in section 2.14.6. The forms of the non-person Determiner <u>hV+#</u> (5.1c) as well as certain features of non-prefixed reduplications can be accounted for by T6.15b.

T6.15b.
$$\begin{vmatrix} +\text{Voc} & \times \times \underline{V} \\ -\text{Con} \\ \alpha \text{Fea} \end{vmatrix} \Rightarrow \begin{vmatrix} +\text{Voc} & \times & +\text{Voc} \\ -\text{Con} \\ \alpha \text{Fea} \end{vmatrix} = \begin{vmatrix} +\text{Voc} & \times & +\text{Voc} \\ -\text{Con} \\ \alpha \text{Fea} \end{vmatrix}$$

Examples are:

(6.15a) $\frac{\#'i\#^{hV+\#^{m}i\#}}{\#'i\#^{hV+\#^{m}i\#}} \Rightarrow \frac{\#'i\#^{hi+\#^{m}i\#}}{\#'i\#^{hV+\#^{m}i\#}} ['i:m]$ 'these' $\frac{\#'a\#^{hV+\#^{m}i\#}}{\#'n} \Rightarrow \frac{\#'a\#^{hV+\#^{m}i\#}}{\#'n} = \frac{\#'a\#^{n}i\#^{n}i\#^{n}i\#}}{\#'n} = \frac{\#'i\#^{n}i\#^{n}i\#^{n}i\#}} [ni!]$ 'I'

However, most non-prefixed reduplications (cf. for example, 2.14.7, 2.16.2) are more confusing. Rather than spell out all the different kinds of reduplication patterns, they are simply assumed as input, at appropriate places, to the phonological rules (section 7).

The following illustrates how confusing non-prefixed reduplication patterns may be. [pi:bi'a-] 'be throwing', as in (2.14j), is based on #pi:'a# 'throw'. The prefixed reduplication involved here must be introduced before the rule whereby postvocalic p is changed to p (7.22). On the other hand, the reduplication involved in p 'beautiful' p 'beautiful' must be introduced at the same time as the rule whereby an anticipatory p is optionally introduced before p (7.62).

6.16. Optional deletion of first person singular subject marker with #mihá:# qá# yə# 'going to go'.

Thus, the more common [mia:qa'] and the less common [mia:-qai n] both occur, both meaning 'I'm going to go', although [mia:qa'] equally well means 'he's going to go'. This transformation seems quite arbitrary, but in fact this deletion has been observed only with this particular Verb with this particular Aspect and it seems to involve only this particular subject marker.

6.17. Adv_{TS} suffix adjustments.

T6.17a.
$$X \cap |-\text{Ten}| + \text{Seg} + \text{Voc} = \frac{\# \cap \text{nu'u\#}}{\text{FROM}} \Rightarrow$$

where X - | -Ten | +Seg | +Voc | # is the phonological representation of a [+Direction] Noun (cf. 2.1.9)

Examples are:

(6.17a) kwi:mknu' 'from the north'

sibinnu' 'from the south'

timinimnu' 'from the west'

wahačnu' 'from the Valley'

Note that T6.17a does not apply to #paya:na# 'far', giving [piya:nanu'] 'from far away' instead of *[piya:nnu'].

T6.17b. [+Direction] $\sim y \neq q \acute{a} \# \Rightarrow$ [+Direction] $(y \neq q \acute{a} \#)$ DIRECTION DIRECTION

The presence of the Direction suffix is optional after Direction Nouns. The following example illustrates this.

- (6.17b) ni: 'timinim(-ika') mia:qa'.

 I WEST(-DIRECTION) GOING-TO-GO
 'I'm going west(-wards).'
- T6.17c. $V \sim y \neq q a \#$ $\Rightarrow V \sim q a \#$ DIRECTION DIRECTION

An example is:

(6.17c) 'ubia pi:na' kwin čurupq ki:yka'

ALREADY THEIR-FATHER QUOT ENTER HOUSE-DIRECTION

V[mimi'-] -qa'.

DIE DIRECTION

'Their father had gone into the house to die.'

T6.17d.
$$\begin{cases} [+Location] & \underline{Y} & \underline{\partial} & \underline{q} & \underline{\acute{a}} \\ [+Plural] & |\alpha Fea| & \beta Fea| & +Com & \delta Fea| & \# \Rightarrow \\ & & prection \end{cases}$$

$$\begin{cases} [+Location] & \frac{k}{2} & \frac{\acute{a}}{2} \\ [+Plural] & | \gamma Fea & | \delta Fea & | \frac{\#}{2} \end{cases}$$
 DIRECTION

- (6.17d) #tukúhpa# ^ ká# [tukwuhwpaka'] 'upward'

 #yəhəbu# ^ ká# [yɨ:buka'] '(to) outside'

 #'a# ^ ča# ^ mɨ# ^ ká# ['ačamɨka'] 'to us'

 #pɨ# ^ mɨ# ^ ká# [pɨmɨka'] 'to them'
- T6.17e. $X \sim y = 0$ $\Rightarrow X \sim y = 0$ DIRECTION DIRECTION

where X is a phonological representation which $\neq \#CV(+)\#$

For an example of yqa# [-yka'], see (6.17c). The following are examples with unreduced yəqa# [-yka'].

- (6.17e) #pi# yaqa# [piyika'] 'to him'

 #pa+# yaqa# [payika'] 'away (toward that one)'
- T6.17f. [aDeterminate] \sim [+Det] \sim +Seg | -Fla | $\frac{\mathring{a}\#}{+$ +Acu | +Com | +Fea | β Fea |

$$\begin{array}{c|c} \underline{n} & \underline{k}^{\underline{W}} \\ [\alpha Determinate] \smallfrown [+Det] \smallfrown & +Seg \\ +Con \\ +Nas \\ +Nas \\ -Fea \end{array} \right| \stackrel{\underline{A}^{\underline{W}}}{=}$$

This transformation accounts for the following forms, where #pi# is [+Segment] and hat# is [+Det _-Person].

(6.17g) #p±# h pá# [p±hpa'] 'on him, her, it'

#'ə# mə# hə+# h pá# ['±m±:hpa'] 'on you sg'

nə# hə+# h pá# [n±:hpa'] 'on me'

Contrast the above examples with the plural forms:

(6.17h) #pi# mi# pi# [pimiba'] 'on them'
'a# ma# : # pi# ['imi:ba'] 'on you plural'

T6.17h. [aDeterminate]
$$\sim$$
 [+Segment] $\left\{\begin{array}{c} pa(')\#\\ LOCATION\\ \underline{nu'u\#}\\ FROM \end{array}\right\} \Rightarrow$

T6.17i. [+N, +[#S#_]]
$$\cap$$
 nu'u# \Rightarrow [+N, +[#S#_]] \cap biu'u# FROM FROM

An example is [toqqwpi'biu'] 'from gambling', as in (1.8h).

6.18. Assimilation of the first person singular possessive prefix.

T6.18. #n
$$\rightarrow$$
 +Seg \rightarrow #n \rightarrow +Seg \rightarrow +Voc +Voc +Dif +Acu \rightarrow Fea

where
$$\underline{C}$$
 is $\begin{vmatrix} +Con \\ +Acu \end{vmatrix}$, but $\underline{C} \neq \underline{\tilde{n}}$ if $\underline{V} = \underline{u}$, and $\underline{C} \neq \underline{s}$ if $V = i$

(6.18a) nitaq 'myself' nile:ba' 'my coat'
niča:q 'my lower leg' niñu 'my possession'
nisarte:nk 'my frying pan' nisa:wa' 'my bread'
niyi' 'my mother' nisi 'my flower'
nira:kw 'my food' nisu:nw 'my (man's)
nina:wa' 'my dress'

Compare these with the following, where $\underline{\partial}$ remains (and is changed to $[\frac{1}{2}]$ by 7.40).

- (6.18b) niki 'my house' niñihñia' 'what I do' niqab 'my ear' niña:m 'my relatives' nipah 'my paternal aunt' niși 'my guts'
- 6.19. Final stress on word-final Determiners.

T6.19.
$$X \cap \left| \begin{array}{c} +\text{Voc} \\ -\text{Con} \end{array} \right| \left(\left\{ \begin{array}{c} \overset{\sim}{-} \\ \pm \end{array} \right\} \right) \# \left\{ \begin{array}{c} \# \\ \# \end{array} \right\} \Rightarrow X \cap \left| \begin{array}{c} +\text{Voc} \\ -\text{Con} \\ +\text{Str} \end{array} \right| \left(\left\{ \begin{array}{c} \overset{\sim}{-} \\ \pm \end{array} \right\} \right) \# \left\{ \begin{array}{c} \# \\ \# \end{array} \right\}$$

where
$$X \sim \begin{pmatrix} +Voc \\ -Con \end{pmatrix} \begin{pmatrix} \frac{\checkmark}{+} \end{pmatrix} \end{pmatrix} \#$$
 is the phonological representation of a Determiner (cf. section 5.1)

- (6.19a) # no# ho+# ⇒ # no# hó+# [ni:'] 'I'

 #'ibi# ⇒ #'ibi# ['ibi'] 'this'

 #'ama # ⇒ #'ama # ['ama'] 'that'

 #hami# ⇒ #hami# [hami'] 'who'
- 6.20. Deletion of Punctual suffix before suffixes beginning with \underline{q} , \underline{k} .

T6.20.
$$\begin{array}{c|c} \underline{\text{qa\#}} & +\text{Con} \\ +\text{Int} \\ -\text{Dif} \\ -\text{Acu} \end{array} \Rightarrow \begin{array}{c|c} +\text{Con} \\ +\text{Int} \\ -\text{Dif} \\ -\text{Acu} \end{array}$$

Examples are:

(6.20a) #məmə'# qə# qá# \Rightarrow #məmə'# qá# [mɨmɨ'qa']

DIE PUNCT GOING-TO DIE GOING-TO

'he's going to die'

#məmə'# qə# qá#

#məmə'# qá# [mɨmɨ'qa']

DIE PUNCT DIRECTION

'to die'

#čρί:č# αθ# ⇒ #čρί:č# ka'#

SHRIVEL PUNCT RESULTATIVE SHRIVEL RESULTATIVE

NOMINAL NOMINAL

[čqi:čka'] 'shriveled thing'

For more on the second example above, see T6.17c and example (6.17c).

6.21. Deletion of case markers with Pronouns.

T6.21. [+Pronoun]
$$\left\{\frac{\underline{\text{Gen}}}{\underline{y}\underline{\partial}\#}\right\} \Rightarrow [+Pronoun]$$

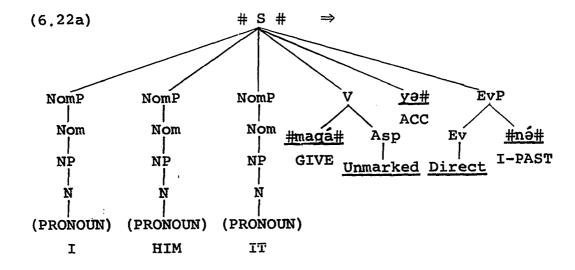

See 6.22 for further consequences of this deletion.

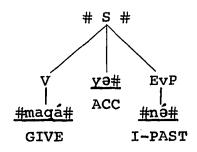

6.22. Simplification of Phrase-markers with phonologically null material.

T6.22. A[B]
$$\Rightarrow$$
 Ø

where B is phonologically null

The following example shows how dramatically Phrasemarkers can be simplified by T6.22.

[maqai ni'.] 'I gave it to him.'

6.23. Reduction of [+Reduce] lexical items. Various lexical items, examples of which are given in (6.23a), are specified as [+Reduce]. These have their phonological representations reduced one syllable in certain contexts by the present transformation.

T6.23a.
$$X \cap \begin{vmatrix} \alpha Voc \\ \beta Con \end{vmatrix} + Voc \begin{vmatrix} \# \cap \# \\ -Con \end{vmatrix} \Rightarrow X \cap \# \cap \#$$

where X \cap $|\alpha Voc|$ +Voc $|\frac{\#}{\#}$ is the phonological pCon $|\beta Con|$ representation of a lexical item that is specified as [+Reduce], and $\alpha = \beta$ or $\alpha = -$ and $\beta = +$

Examples are:

(6.23a) #ni+ ^#yə́kə# ⇒ #ni+ ^#yə́# [niyɨ'] 'my mother'

#ni+ ^#ná'ana# ⇒ #ni+ ^#ná'a# [nina']

'my father'

#nə+ ^#kákə# ⇒ #nə+ ^#ká# [nɨka']

'my paternal grandrelative'

#'a+ ^ #pohóqa# ⇒ #'a+ ^ #pohó# ['apo:']

'its road'

#čawəhə́# ⇒ #čawə# [čau] 'gather!'

#'ičú'# ^ q ^ ina# ⇒ #'ičú'# ^ q ^ i# ['iču'k]

MAKE PUNCTUAL CAUSATIVE 'make it!'

Compare the forms of (6.23a) with the longer forms below.

(6.23b) #ni+ ~ #yə́kə# ~ yə# [niyɨki] 'my mother (Acc)'

#ni+ ~ #ná'an ~ i# [nina'n] 'my father's (Gen)'

#nə+ ~ #kák ~ i# [nɨkak]

'my paternal grandrelative's (Gen)'

#pohóqa+# ~ ta# [po:qt] 'road'

#čawəhə́# ~ yə# [čawe(:)i] 'he gathers'

#'ičú'# ~ q ~ ina# ~ yə# (which is reduced to

#'ičú'# ~ q ~ ina# by T6.26a) ['iču'kin]

'he makes'

ina# Causative is reduced to i# in other contexts as well.

T6.23b. $\underline{ina\#} \cap X \Rightarrow \underline{i\#} \cap X$ CAUSATIVE CAUSATIVE

where X \neq Asp, \underline{y} Accusative, [+N], Adv $_{TS}$

Examples are:

(6.23c) # #<u>Ki</u>#mi# #'j:m'q i# çu'a# #

WE-PAST END CAUS MOTION

[Kimi 'i:m'kiçu'.] 'We finished it.'

(6.23d) # #munaáng i# ičuna# yə# #nə# #

BOIL CAUS BENEFACTIVE ACC I

[munankčunai n.] 'I'm boiling it for him.'

Examples in which ina# Causative remains unreduced are:

- (6.23e) mi:sk-ina- -qa- -i n.

 DAMPEN-CAUS-GOING-TO-ACC I

 'I'm going to wet it.'
- (6.23f) mi:sk-ina-i n.

 DAMPEN-CAUS-ACC I

 'I'm wetting it.'
- (6.23g) wa:n'k-in- N[-i'aç] 'digger'
 DIG-CAUS -ER
- (6.23h) ni-wa:n'k-in- N[-ihwa'] 'my digging tool'
 MY-DIG-CAUS-INSTRUMENT
- (6.23i) ni: 'qai ni 'ahkw' 'i: njkwa' kim welyam
 I NOT I-PAST HERE THIS-WAY COME DISHES

 yarukwk-ina- Adv_{TS}[-qa'].

 CLEAN-CAUSATIVE TO

 'I didn't come here to wash dishes.'

6.24. Stylistic reordering. It is at this point that stylistic reorderings are introduced. The transformations that apply after this point operate on already reordered material. No formalization is made here of the device which accomplishes the reordering other than to note some of the limitations on reordering.

It would seem that any kind of reordering of whole words is permitted within a constituent dominated by S, with the following restrictions:

- (1) conjoined constituents remain next to each other and Conjunctions remain between the conjoined constituents;
 - (2) Sentence adverbial material remains together;
- (3) if the adverbial involves [pibeipa'] 'if' or ['ayaip] 'because', that word is first in the adverbial;
- (4) Manner adverbial constituent order is limited as specified in section 3.1.7;
- (5) immediate constituents of Noun-Phrases remain in order, that is, possessor Nouns precede possessed Nouns, and Noun plus nominalization from T3.2.5a remains in order, such that (6.24a) is grammatical, while (6.24b) is not;
- (6.24a) mia:ç şiri: 'nka'ti n hihiy.

 MOON RED-ONE-ACC I SEE-ACC

 'I see a red moon.'

- (6.24b) *siri: 'nka' mia:ci n hihiy.

 RED-ONE MOON-ACC I SEE-ACC

 '*I see a moon red.'
- (6) the Evidential-Phrase material remains unaffected by stylistic reordering, and is reordered as specified in T6.25.

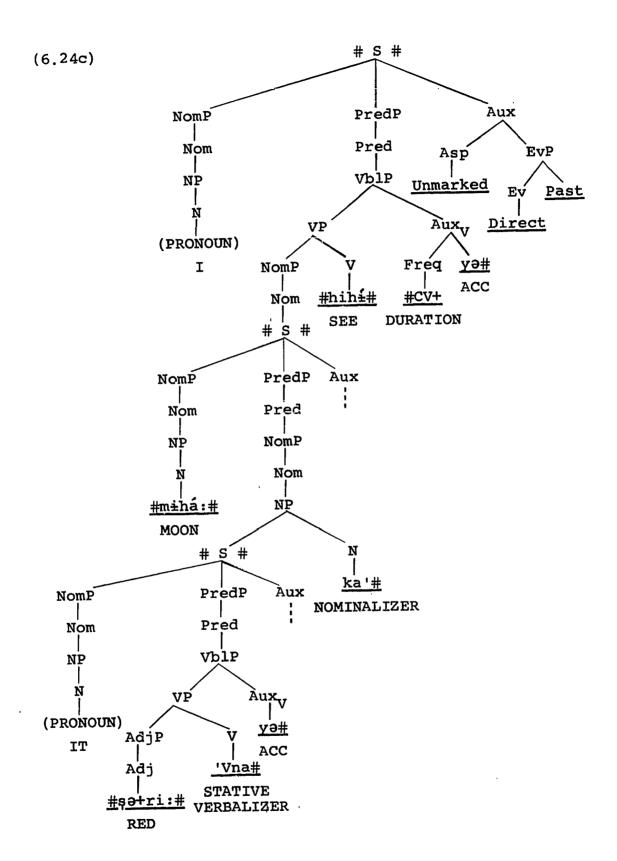

Some examples of possible reorderings are given in (0.3a). All twelve different orders of (0.3a) are based on the deep structure represented in (6.24c) (next page).

6.25. Reordering of Evidential-Phrase material (cf. section 1.4.1).

T6.25. #
$$(Adv)^n X \cap Y \cap EvP[Z (?)] \Rightarrow$$

$$(Adv)^n \left\{ \begin{array}{l} PM[Z] \cap X \\ X \cap PM[Z] \end{array} \right\} Y (?)$$

where X is dominated by a single node or has a phonological representation which contains no instance of ##; the phonological representation of X ends in # and that of Y begins in # if Y is non-null; except that if the phonological representation of Z consists of no

cannot be Sentence-initial

PM = Person marker (This node is needed for T6.26.)

With regard to examples to illustrate the above transformation, see (1.4m-p-q) for Z - X - Y, (1.4k-t-n-o-s) for X - Z - Y, (1.4d-j-r) for Z - X - Y - ?, (1.4e-f-g-h-i) for X - Z - Y - ?, (1.7b-c) for Adv - Z - X - Y, (1.6g) and (1.2b) for Adv - X - Z - Y, and (1.2c) for Adv - Adv - Adv - Adv - Adv - X - Z - Y.

The distribution of the Evidential-Phrase material as specified by T6.24 is the best known guide to syntactic surface structure in Serrano. Note that by T6.6a-b the Predicate node is destroyed, rendering (6.25a) ungrammatical, that is, unacceptable to the informant.

But 6.6a-b do not apply to Imperatives, \underline{y} Accusative having been deleted earlier by T3.1.14a. Thus (6.25b) is grammatical, [k^W ut maqa-] being dominated by the single node, Pred.

6.26. Deletion of Accusative case after certain Verbs.

T6.26a.
$$V \cap Asp \cap \underline{ya\#} \cap X \Rightarrow V \cap Asp \cap X$$
ACC

where
$$X \neq PM$$
 (cf. T6.25)

For examples, see (4.4b-c), (4.5b). For examples of the non-deletion of Accusative when X = PM, see (1.4f), (1.14a). Note that this transformation applies only in the case of [-A] Aspects, because of the prior application of T6.6a.

T6.26b.
$$V[X] \cap \underline{y} = V[X] \cap Y$$

where Y
$$\neq$$
 PM and X is a phonological representation whose last segment is $\begin{vmatrix} + \text{Voc} \\ -\text{Ten} \\ -\text{Str} \end{vmatrix}$
but X \neq $\#$ $|+\text{Seg}|$ $|+\text{Voc}|$ $|+\text{Con}|$ $|+\text{Seg}|$ $|+\text{Con}|$

Note that T6.26b applies when Future Aspect is involved, because of T6.6a.

The following are examples of Verbs with Accusative case deleted by T6.26b.

But note, for example, $\frac{\# \text{kima}\#}{y \ni \#}$ [kimai] 'come' with Accusative in (1.6 ℓ) where it is followed by the Person marker [$k^W \pm n$] (Quotative-third person singular subject).

The following illustrate the exceptions to T6.26b.

(6.26b) includes examples of the shape # | +Seg | +Voc | -Ten |

aVoc | (| +Seg |)#.

(6.26c) includes examples having stressed or long stemfinal vowels.

Note that the last three examples above could equally well be included in (6.26b).

T6.26c.
$$V[X] \cap y \ni \# \cap Ev \cap Y \Rightarrow V[X] (y \ni \#) Ev \cap Y$$

where X is as specified for T6.26b and Y does not contain ?

Thus, with a following Evidential, Accusative case is optionally deleted. as in the following examples.

(6.26d) şi:'b (-i) ta.

BLOOM-FUTURE (ACC) DUBITATIVE-THEY

'They'll bloom.'

- (6.26e) piču:çu'(-ai) k^Win.

 ARRIVE-MOTION(ACC) QUOTATIVE

 'He arrived.'
- 6.27. Deletion of plural suffix with Going-to Aspect (see T4.4b for the introduction of the plural suffix after [-A] Aspects).

T6.27.
$$\begin{bmatrix} -A \\ +C \end{bmatrix} \sim \begin{bmatrix} +Segment \\ +Plural \end{bmatrix} \sim \underbrace{y \ni \#}_{ACC} \Rightarrow \begin{bmatrix} -A \\ +C \end{bmatrix} \sim \underbrace{y \ni \#}_{ACC}$$

$$\underbrace{g \acute{a} \#}_{GOING-TO} \qquad \qquad \underbrace{GOING-TO}$$

An example is:

- (6.27a) k^Wa'-qa-i tač ? patai.

 EAT-GOING-TO-ACC DUB-WE QUESTION THAT-ONE-ACC

 'Are we going to eat it?'
- 6.28. Restructurings with Accusative case and the ${\tt Adv}_{TS}$ ${\tt \underline{wV\#}}$ 'while...-ing'.

For Louie Marcus's speech, it seems that α must = -. Compare his [Cikabayi-] 'our knives (Acc)' in (4.7a) with Sarah Martin's

T6.28b.
$$X \cap \begin{vmatrix} +Voc \\ -Con \end{vmatrix} \stackrel{\#}{=} \underbrace{WV\#} \Rightarrow X \cap \underbrace{WV\#}$$

Examples are:

T6.28c.
$$V[X \cap | +Voc | -Con | +Voc | #] \cap | +Voc | \Rightarrow +Con |$$

(6.28d)
$$V[\frac{\#ya'a\#}] \cap y \ni \# \Rightarrow V[\frac{\#ya'}] \cap y \ni \# [ya'i]$$
 'he runs'
$$V[\frac{\#ya'a\#}] \cap \underline{wV\#} \Rightarrow V[\frac{\#ya'}] \cap \underline{wV\#} [ya'u]$$
 'while running'

Compare [ya'i] and [ya'u] with [hwu'ai] 'burn' and [hwu'au] 'while burning' to see that Verbs in non-a $\frac{1}{2}$ are unaffected by T6.28c.

T6.28d.
$$V[X \cap | +Voc | #] \cap | +Voc | \Rightarrow V[X \cap | +Voc | #] \cap | +Voc | +Con |$$

(Stress earlier in the word is later deleted by 7.26.) Examples are:

(6.28e) #yú: 'a# ¬y∂# ¬#m±# → #yú: 'á# ¬y∂# ¬#m±#

[yu: 'ai m] 'they cry'

#kima# ¬wV# → #kimá# ¬wV# [kimau] 'while coming'

#ñíha:# ¬wV# → #ñíhá:# ¬wV# [ñia:w] 'while doing'

The difference between [ñia:w] 'while doing' and [ñihai] 'do (Acc)' (apparently from #ñiha:# ~ yə#) remains unexplained.

T6.28e.
$$X \cap y \ni \# \Rightarrow X \cap y \#$$

where X contains no instance of ## and X is dominated by V or contains | +Str |

Only after stressless Noun stems and Determiners does Accusative case have its full form, as in (4.7a), (1.11b).

T6.28f.
$$|+Voc| # y# \Rightarrow y#$$
-Con
-Ten
-Str

A final short unstressed vowel is deleted before <u>y#</u> Accusative case. Note that this transformation does not apply to the final vowel of a stressless stem because in that position Accusative case is not changed from <u>y#</u> to <u>y#</u> by T6.28e. Examples illustrating T6.28f are:

Stressed vowels, long vowels, and final unstressed vowels of stressless stems are retained before Accusative case. Examples are:

(6.28g) #mihá:# y# [mi(:)(y)] 'go'

#mihá:# qá# y# #nə# [mia:qai n]

'I'm going to go'

#'ə́nanə́# y# #nə# ['ɨnanɨi n] 'I know it'

#'a+ #şɔ́:# y# ['aṣɨ(:)i] 'its flower (Acc)'

#'ama # yə# ['amai ~ 'amayɨ-] 'that (Acc)'

#ku+# ta# yə# [kwutai ~ kwutayɨ-] 'fire (Acc)'

#ni+ #şu:ŋa# yə# [niṣu:ŋai ~ niṣu:ŋayɨ-]

'my (man's) daughter (Acc)'

7. PHONOLOGY

7.0. The rules of this section operate entirely on the distinctive features and boundaries sketched out in section 6.0. The irregular use of the concatenation arc (^) is simply for reasons of clarity. The arc has no phonological value. The output of this section, except where noted to the contrary, is identical with the phonetic notation used throughout.

7.1.
$$(\underline{\#})^n \Rightarrow (\underline{\#})^{n-1}$$

where n is an odd number

An example is:

The # between # Genitive case and #'a+ 'its' in the above example is introduced by T3.1.1.

7.2.
$$\begin{vmatrix} +\text{Voc} \\ -\text{Con} \\ \alpha \text{Ten} \end{vmatrix}$$
 \Rightarrow $\begin{vmatrix} +\text{Voc} \\ -\text{Con} \\ +\text{Ten} \end{vmatrix}$

where F is null

An example is:

(7.2a)
$$\#k^{W} \ni n \ni \uparrow : \# \Rightarrow \#k^{W} \ni n \ni : \# [k^{W} \ni n \ni]$$
 'Quotative-they'

7.3.
$$\begin{vmatrix} +Voc & +Str & \Rightarrow & +Voc \\ -Con & +F & & -Con \\ aStr & & +Str \end{vmatrix}$$

where F is null

An example is:

(7.3a)
$$\#\check{c} \pm m \pm \frown \# \Rightarrow \#\check{c} \pm m \pm \# [\check{c} \pm m \pm ']$$
'we-past'

7.4.
$$\left| \begin{array}{c} +Str \\ +F \end{array} \right| \Rightarrow \emptyset$$

where F is null

An example is:

(7.4a)
$$\underline{\#m'} \cap \underline{\H} \Rightarrow \underline{\#m'\#} [m'] 'you (it) (past)'$$

7.5.
$$X \left(\begin{array}{c|c} -Voc \\ -Con \end{array} \right) \begin{array}{c|c} +Con \\ +Com \end{array} \xrightarrow{Y} X \left(\begin{array}{c|c} -Voc \\ -Con \end{array} \right) \begin{array}{c|c} +Con \\ -Com \end{array} \xrightarrow{Y}$$

where either X or Y =
$$\begin{vmatrix} +Voc & , i.e., \underline{u}, \underline{i}, \\ \alpha Con & -\alpha Dif & \\ \beta Acu & -\beta Fla & \end{vmatrix}$$

There is no example with $\underline{\mathbf{u}}$.

7.6.
$$\#$$
 | +Voc | \Rightarrow $\#$ | +Seg | +Voc | -Con |

The unique example is:

(7.6a) $\frac{\text{#uba:} \text{'ta#}}{\text{ta#}} \Rightarrow \frac{\text{#huba:} \text{'ta#}}{\text{ta#}} [h^{W}uba:č] 'eye'$

7.7.
$$\begin{vmatrix} -Voc & +Voc & \Rightarrow & -Voc & +Voc \\ -Dif & -Con & -Dif & -Con \\ -Acu & \alpha Acu & -Acu & \alpha Acu \\ -\alpha Gra & +Fla & +Fla \end{vmatrix}$$

Rounding of vowels is anticipated in the preceding back consonant. Examples are:

Note that back consonants are not rounded before w:

(7.7b) #wihwi'ina# [wihwi'n] 'be shouting' #manaá'kwV# [mana'ku] 'while returning'

The rounding of <u>k</u> and of <u>h</u> before <u>o</u> has not been indicated simply because the diacritic (^w) would suggest to the reader a considerably greater amount of lip rounding than is the case in this position. However, just because examples like #kó:\(\frac{k}{0}\)'# 'pig', #hohú:\(\eta \text{ana#}\) 'be poor' are tran-

scribed [ko:či'], [hou:ŋan] rather than [kwo:či'], [hwou:-ŋan] is not to say that the rounding of the \underline{o} is not anticipated in the preceding \underline{k} or \underline{h} .

Observations of much the same sort apply to the glottal stop. For graphic convenience, ['W] is not distinguished from ['], but again, this is not to say that '_ is exempted from rule 7.7.

7.8.
$$\begin{vmatrix} +\text{Voc} \\ -\text{Con} \end{vmatrix} + \begin{vmatrix} +\text{Voc} \\ +\text{Con} \\ +\text{Acu} \\ -\text{Fea} \end{vmatrix} = \begin{vmatrix} -\text{Voc} \\ -\text{Con} \end{vmatrix} \Rightarrow \begin{vmatrix} +\text{Voc} \\ +\text{Voc} \\ -\text{Con} \end{vmatrix} = \begin{vmatrix} +\text{Woc} \\ -\text{Con} \end{vmatrix}$$

Examples are:

(7.8a) #qáy# ↑ #hahihi+pa# ⇒ #qá# ↑ #hahihi+pa# [qa hai:p]
'nowhere'
#qáy# ↑ #'a'áyə# ⇒ #qá# ↑ #'a'áyə# [qa 'a'ai]
'not good, no good'

7.9.
$$\begin{vmatrix} +\text{Voc} \\ -\text{Con} \\ -\text{Ten} \\ -\text{Str} \end{vmatrix} \left(\left\{ \begin{array}{c} \pm \\ - \end{array} \right\} \right) \# \Rightarrow \#$$

Final short unstressed vowels are deleted. Examples are:

(7.9a) $\frac{\#p\acute{a}:ta\#}{\#ni+y\acute{b}k^{\pm}\#}$ \Rightarrow $\frac{\#pa:t\#}{\#ni+y\acute{b}k\#}$ [niy $^{\pm}k$] 'my mother's (Gen)'

#'ama'y# \Rightarrow #'ama'y# ['amai] 'that (Acc)' #'a+mahi:ra'# \Rightarrow #'amahi:r# ['amai:r] 'his son' $\#m\phi:'a+#$ \Rightarrow $\#m\phi:'#$ [$m\phi:'$] 'it's smokey'

7.10.
$$V[\# \mid +Seg \mid \alpha Fea \mid +Seg \mid] \cap ? \Rightarrow \beta Ten \mid \gamma Str \mid$$

An example is:

(7.10a) $\# k^W \partial ' \# \varphi \# h^W \varphi ' ? \# \Rightarrow \# k^W \partial ' \# \varphi \# h^W \varphi ' \varphi ? \#$ CAN YOU SEW QUES $[k^W \dot{\pm} ' \varphi h^W \varphi ' \varphi ?] 'Can you sew?'$

7.11.
$$\left|\begin{array}{c|c} +\text{Voc} & \times & +\text{Int} & -\frac{?}{?} \\ -\text{Con} & +\text{Ten} \end{array}\right|$$

An example is:

7.12.
$$\begin{vmatrix} -\text{Con} & -\text{Voc} & \Rightarrow & -\text{Con} & -\text{Voc} \\ +\text{Acu} & +\text{Acu} & +\text{Acu} & +\text{Acu} \\ +\text{Dif} & & -\text{Dif} \\ +\text{Int} & & -\text{Fla} \end{vmatrix}$$

7.13.
$$| + \text{Voc} | - \text{Voc} | \Rightarrow | + \text{Voc} | - \text{Voc} | + \text{Dif} | + \text{Acu} | + \text{Fla} | + \text{Int} |$$

7.14.
$$|+Str|+Seg|+Nas| \cap X \Rightarrow |+Str|+Nas| \cap X$$

where X = # or #

Examples are:

(7.14a) $\frac{\#h^W u k \acute{a}h m \#}{\#h \circ h m \#} \Rightarrow \frac{\#h^W u k \acute{a} : m \#}{\#h \circ h m \#} [h^W u k a : m] 'deer (plural)'$ $\frac{\#h^W u k \acute{a}h m \#}{\#h \circ h m + n \circ h m \#} [n \dot{a} n \dot{a} : m] 'women'$

7.15.
$$\begin{vmatrix} \alpha \text{Voc} \\ \beta \text{Con} \end{vmatrix} + \text{Nas} \begin{vmatrix} -X \Rightarrow & \alpha \text{Voc} \\ + \text{Gra} \end{vmatrix} + \begin{vmatrix} \text{Seg} \\ \beta \text{Con} \end{vmatrix} + \begin{vmatrix} \text{Voc} \\ + \text{Dif} \\ + \text{Com} \end{vmatrix} + \begin{vmatrix} \text{Com} \\ + \text{Com} \end{vmatrix} + \frac{\text{Com}}{\text{Com}} + \frac$$

where
$$\alpha = \beta$$
 or $\alpha = -$ and $\beta = +$, and $X = \underline{\#}$ or $\#$

Examples are:

(7.15a) #ba+ri:1^Ym# ⇒ #ba+ri:1^Yiam# [bari:1^Yam]

'barrels'

#pi:+pulin m# ⇒ #pi:+pulin iam# [pu:puliniam]

'their daughters'

#fransé:sm# ⇒ #fransé:siam# [franse:siam]

'the French'

#bá:ka'm# ⇒ #bá:ka'iam# [ba:ka'iam] 'cows'

#yuhá:qahm# ⇒ #yuhá:qahiam# [yua:qaiam]

'Chemehuevis'

7.16.
$$|\alpha \text{Ten } |(\underline{+})| + \text{Voc } | \Rightarrow |-\text{Ten } | + \text{Voc } |$$

(7.16a)
$$\frac{\#p\dot{\pm}:+ \circ \underline{u}:b\acute{a}\#}{\#'\underline{a}+ \circ \underline{u}:b\acute{a}\#} = \frac{\#p\dot{\pm}\underline{u}:b\acute{a}\#}{\#'\underline{a}\underline{u}:b\acute{a}\#}$$
 ['ou:ba'] 'his eye'

7.17.
$$\begin{vmatrix} +\text{Seg} \\ +\text{Voc} \\ +\text{Gra} \\ \alpha + \text{Com} \end{vmatrix}$$
 $\begin{vmatrix} +\text{Fla} \\ +\text{Fla} \end{vmatrix}$ $\begin{vmatrix} +\text{Fla} \\ +\text{Fla} \end{vmatrix}$ $\begin{vmatrix} +\text{Fla} \\ +\text{Fla} \end{vmatrix}$

Examples are:

(7.17a)
$$\frac{\#p \div u : b \acute{a}\#}{\# u : b \acute{a}\#} \Rightarrow \frac{\#pou : b \acute{a}\#}{\# pou : b \acute{a}\#}$$
 [pou:ba'] 'their eyes' $\frac{\#m \circ u : b \acute{a}\#}{\# u : b \acute{a}\#} \Rightarrow \frac{\#mou : b \acute{a}\#}{\# ou : b \acute{a}\#}$ ['ou:ba'] 'his eye'

7.18.
$$\begin{vmatrix} +\text{Voc} & +\text{Nas} & \Rightarrow & | +\text{Voc} & | +\text{Nas} & | \\ -\text{Con} & +\text{Dif} & | & -\text{Con} & | +\text{Dif} & | \\ -\text{Gra} & +\text{Acu} & | & +\text{Fla} & | +\text{Fla} \end{vmatrix}$$

 \underline{n} is made retroflex after retroflex vowels. An example is:

Note that \underline{n} remains unchanged after vowels that are retroflexed subsequent to this rule. An example is:

(7.18b) #pi:+nq:bof [pi:nq:bo] 'their feet'

7.19.
$$\begin{vmatrix} +\text{Voc} & +\text{Con} & -\text{Ten} \end{vmatrix}$$
 \Rightarrow $\begin{vmatrix} +\text{Voc} & +\text{Con} & -\text{Ten} \end{vmatrix}$ \Rightarrow $\begin{vmatrix} +\text{Con} & +\text{Com} & +\text{Com} & +\text{Com} & +\text{Int} \end{vmatrix}$

In certain positions \underline{q} seems to alternate freely with \underline{X} . Examples are:

(7.19a) #q^Wq:naqá+t# ~ #q^Wq:naXá+t# [q^Wq:nqat ~ q^Wq:nXat]

'necklace'

#təhtəyəqá# ~ #təhtəyəXá# [tɨhtɨyɨka' ~

tɨhtɨyɨxa'] 'he's going to work'

#baá:qq# ~ #baá:Xq# [ba:qq ~ ba:Xq] 'it twists'

7.20.
$$\frac{V_1(:)(')}{|+V_2|}$$
 $\frac{V_2}{|+V_2|}$ $\frac{|+V_2|}{|+V_2|}$ $\frac{|+V_2|}{|+V_2|}$

$$\begin{array}{c|cccc} \underline{V}_1 & \underline{V}_2(:)(\) & \underline{\ } \\ + \text{Voc} & + \text{Voc} & -\text{Con} & +\text{Con} \\ -\text{Ten} & \alpha \text{Ten} & +\text{Int} \\ -\text{Str} & \beta \text{Str} \\ \gamma \text{Fea} & \delta \text{Fea} \end{array}$$

(7.21a)
$$\frac{\#pii+t\pm i\cdot q\#}{\#k^{W}aa\cdot \cdot \cdot q\#} \Rightarrow \frac{\#pi+t\pm \cdot q\#}{\#k^{W}aa\cdot \cdot \cdot q\#} = \frac{\#k^{W}a\cdot \cdot \cdot q\#}{\#k^{W}a\cdot \cdot \cdot q\#} = \frac{\#k^{W}a\cdot \cdot \cdot q\#}{\#k^{W}a\cdot \cdot \cdot q} = \frac{\#k^{W}a\cdot \cdot \cdot q\#}{\#k^{W}a\cdot \cdot \cdot q\#} = \frac{\#k^{W}a\cdot \cdot \cdot q\#}{\#k^{W}a\cdot \cdot \cdot q} = \frac{\#k^{W}a\cdot \cdot \cdot q\#}{\#k^{W}a\cdot \cdot q} = \frac{\#k^{W}a\cdot \cdot \cdot q\#}{\#k^{W}a\cdot \cdot q} = \frac{\#k^{W}a\cdot \cdot q}{\#k^{W}a\cdot \cdot q} = \frac{\#k^{W}a\cdot q}{\#k^{W}a\cdot q} = \frac{\#k^{W}a\cdot q}{\#$$

7.22.
$$\begin{vmatrix} +\text{Voc} & -\text{Voc} & \Rightarrow & | +\text{Voc} & | +\text{Voc} & | +\text{Voc} & | +\text{Con} & | -\text{Con} & | +\text{Con} & | +\text{Gra} & | +\text{Int} & | +\text{Int$$

<u>p</u> is vocalized to <u>b</u> after any vowel except <u>u</u> (or <u>o</u>). The feature Interrupted is parenthesized to emphasize the fact that were it not for a few Spanish loanwords with \underline{f} (e.g., [kafe:'] 'coffee'), the fact that <u>p</u> is a stop (and that <u>b</u>

is not) would not have to be distinguished. Examples are:

(7.22a) #pá:p# ⇒ #pá:b# [pa:b] 'on the water'

#pí:pi:'# ⇒ #pí:bi:'# [pi:bi'] 'throw things'

7.23.
$$\begin{vmatrix} \pm Voc & -Voc & \Rightarrow & \pm Voc & \pm Voc \\ -Con & \pm Con & \pm Gra & \pm Gra \\ +Gra & (\pm Int) & (\pm Int) \end{vmatrix}$$

The vocalization of \underline{p} seems to be optional after \underline{u} (and presumably also after \underline{o} , but there is no example), as in the following:

(7.23a) #tú:p# ~ #tú:b# [tu:p ~ tu:b] 'on the coal'

An example is:

(7.24a) #'ou:ba'p# \Rightarrow #'ou:bap# ['ou:bp] 'in his eye'

7.25. |+Con |
$$\#$$
 |+Nas | $\#$ |+Con | +Seg |+Seg |+Nas | $\#$ |+Voc |+Voc |+Com |+Acu |

An example is:

...#'ayah++piam##ta:miha+t##'a+mahi:ram#

[...'ayaipiam ta:miat 'amai:ham.]

'...because they were the Sun's children.'

7.26.
$$X \cap |+Str| \cap Y \cap |+Str| \cap Z \Rightarrow X \cap |-Str| \cap Y \cap |+Str| \cap Z$$

where X begins with # or # and Z ends with
or # and Y does not contain

An example is:

(7.26a) #tuk^Wúhpaká# ⇒ #tuk^Wuhpaká# [tuk^Wuh^Wpaka'] 'upwards'

Compare (7.26a) with #tuk winpaç# [tuk wuh pc] 'sky'. Without the stress deletion specified in rule 7.26, 'upwards' would be *[tuk wuh pka'].

7.27.
$$\begin{vmatrix} +\text{Voc} \\ -\text{Con} \\ -\text{Ten} \\ -\text{Str} \end{vmatrix} \xrightarrow{\text{Fea}} \begin{vmatrix} -\text{X} \\ -\text{X} \\ -\text{Con} \\ -\text{Ten} \\ -\text{Str} \end{vmatrix}$$

where
$$X = \begin{vmatrix} +Voc \\ -Con \end{vmatrix}$$
 or # or #

(7.27a) #ñiá:h# ⇒ #ñiá:# [ñia] 'do it!'

#wihí:č# ⇒ #wií:č# [wi:č] 'acorn mush'

#nəhô+# ⇒ #nəô+# [nɨ:'] 'I'

#'aha+p# ⇒ #'aa+p# ['a:p] 'there'

#'a+mahí:r# ⇒ #'a+maí:r# ['amai:r] 'his son'

#yuhá:qahiam# ⇒ #yuá:qaiam# [yua:qaiam]

'Chemehuevis'

#nə+'ohó# ⇒ #nə+'oó# [nɨ'o:'] 'my bone'

With regard to evidence for intervocalic h in the underlying forms of the above, consider the possessed form of 'acorn mush', restructured by the transformations of section 6.13:

(7.27b) $\frac{\#n + \gamma \text{wi:h}}{y \#}$ [niwi:hi] 'my acorn mush (Acc)'

For some reason, not yet understood, the Future form of #\ni\u00e4niha:\u00e4 'do' loses its intervocalic \u00e1: [\u00fai:b] (cf. \u00e4\u00e4\u00e4niha:\u00e7\u00e4 [\u00e4ihai] 'do').

7.28.
$$\left|\begin{array}{c|c} \alpha \text{Ten} & \left|\frac{(+)}{2}\right| + \text{Seg} & + \text{Voc} & \left|\frac{(+)}{2}\right| - \text{Voc} & \Rightarrow \\ -\text{Con} & -\text{Ten} & -\text{Nas} & -\text{Nas} & \Rightarrow \\ -\text{Str} & -\text{Str} & -\text{Nas} & -\text{Nas} & \Rightarrow \\ \end{array}\right|$$

$$\left|\begin{array}{c|c} \alpha \text{Ten} & \left| \left(\underline{+} \right) \right| + \text{Seg} & -\text{Voc} \\ \beta \text{Str} & +\text{Con} \\ -\text{Nas} & -\text{Nas} \end{array}\right|$$

where α or $\beta = +$

Examples are:

(7.28a) #ná:bə+t# ⇒ #ná:bt# [na:bt] 'prickly pear'

#pá:čaXa+t# ⇒ #pá:čXa+t# [pa:čXt] 'rifle'

#maqáhwu+t# ⇒ #maqáhwt# [maqahwt] 'dove'

#wálYa+t# ⇒ #wálYt# [welYt] 'dish'

#şumá:na+t# ⇒ #şumá:nt# [şuma:nt]

'bow-and-arrow'

#hwó:mič# ⇒ #hwó:mč# [hwo:mč] 'witch doctor'

#na:naqá# ⇒ #na:nqá# [na:nqa']

'he's going to look for it'

#poóga+t# ⇒ #poógt# [po:qt] 'road'

7.29.
$$\left|\begin{array}{c|c} \alpha \text{Ten} & \left|\frac{(+)}{+}\right| + \text{Seg} & -\text{Voc} & +\text{Voc} & \left|\frac{(+)}{+}\right| - \text{Voc} & \Rightarrow \\ \beta \text{Str} & +\text{Con} & -\text{Ten} & -\text{Nas} & -\text{Nas} & \Rightarrow \\ -\text{Str} & -\text{Str} & -\text{Nas} & -\text{Nas} & -\text{Nas} & \Rightarrow \\ -\text{Nas} & -\text{Na$$

$$\left| \begin{array}{c|c} \alpha \text{Ten} & \left| \left(\frac{+}{2} \right) \right| + \text{Seg} & -\text{Voc} & -\text{Voc} \\ \beta \text{Str} & +\text{Con} & +\text{Con} \\ -\text{Nas} & -\text{Nas} \end{array} \right|$$

where α or $\beta = +$

Examples are:

(7.29a) #pá:čXa+t# ⇒ #pá:čXt# [pa:čXt] 'rifle'

#yə'a:yə'áhkičun# ⇒ #yə'a:yə'áhkčun#

[y±'a:y±'ahkčun] 'he's making it pretty for him'

7.30.
$$\begin{vmatrix} +\text{Voc} \\ -\text{Con} \end{vmatrix}$$
 $\begin{vmatrix} +\text{Seg} \\ +\text{Voc} \\ +\text{Int} \\ \alpha \text{Fea} \end{vmatrix}$ $\stackrel{\triangle}{}$ $\stackrel{\triangle}{}$

Examples of \underline{r} changing to \underline{h} are:

Examples where <u>r</u> remains are:

(7.30b) #'a+mai:r# ['amai:r] 'his son'

#hworo:+pi'bəc# [hworo:pi'bɨc] 'deep basket'

#ru+rá:sna'# [rura:sna'] 'peach'

where
$$X = \#$$
 or $\#$ and $Y \neq \#$ -Voc -Con

The glottal stop is not introduced however, when the following word begins with $\underline{}$ or $\underline{}$. For examples, see (7.8a).

7.32.
$$\begin{vmatrix} \underline{V}_1 & \underline{V}_1 \\ +\text{Voc} \\ \alpha \text{Fea} \end{vmatrix}$$
 $\begin{vmatrix} \underline{V}_1 \\ +\text{Voc} \\ \alpha \text{Fea} \\ \beta \text{Str} \end{vmatrix}$ \Rightarrow $\begin{vmatrix} \underline{V}_1 \\ +\text{Voc} \\ +\text{Ten} \\ \alpha \text{Fea} \\ \beta \text{Str} \end{vmatrix}$

Examples are:

7.33.
$$\begin{vmatrix} +\text{Con} & +\text{Seg} & +\text{Voc} \\ -\text{Dif} & +\text{Voc} & \alpha\text{Con} \\ -\text{Acu} & \beta\text{Ten} & -\alpha\text{Dif} \\ +\text{Fla} & \gamma\text{Str} & +\text{Acu} \\ & -\text{Fea} \end{vmatrix}$$
 \Rightarrow $\begin{vmatrix} +\text{Con} & +\text{Seg} & +\text{Voc} \\ -\text{Dif} & +\text{Voc} & \alpha\text{Con} \\ -\text{Acu} & +\text{Acu} & -\alpha\text{Dif} \\ +\text{Fla} & \beta\text{Ten} & +\text{Acu} \\ & & & & & & & & & & & & & & & \\ & & & & & & & & & & & & \\ & & & & & & & & & & & & \\ & & & & & & & & & & & & \\ & & & & & & & & & & & & & \\ & & & & & & & & & & & & \\ & & & & & & & & & & & \\ & & & & & & & & & & & \\ & & & & & & & & & & & \\ & & & & & & & & & & & \\ & & & & & & & & & & & \\ & & & & & & & & & & & \\ & & & & & & & & & & & \\ & & & & & & & & & & \\ & & & & & & & & & & \\ & & & & & & & & & & \\ & & & & & & & & & & \\ & & & & & & & & & & \\ & & & & & & & & & & \\ & & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & & \\ & & & & & & & & \\ & & & & & & & & \\ & & & & & & & & \\ & & & & & & & & \\ & & & & & & & & \\ & & & & & & & & \\ & & & & & & & & \\ & & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & &$

7.34. |-Gra | +Seg | +Voc | -Con |
$$\Rightarrow$$
 +Voc | +Int | \Rightarrow +Com | +Dif | -Fea | +Acu |

The following examples illustrate the non-assimilation of \underline{a} to a following \underline{i} when the preceding consonant is Grave.

(7.34b) #mabai'b# [mabai'b] 'rub (Future)'

#pai: 'b# [pai: 'b] 'drink (Future)'

#pisqai'b# [pisqai'b] 'rot (Future)'

7.35.
$$\begin{vmatrix} 1 & 1 & k \\ +\text{Voc} & +\text{Seg} \\ -\text{Con} & +\text{Int} \\ +\text{Dif} & -\text{Fea} \end{vmatrix}$$
 \Rightarrow $\begin{vmatrix} +\text{Voc} & +\text{Seg} \\ -\text{Con} & +\text{Con} \\ +\text{Dif} & +\text{Int} \\ +\text{Acu} \end{vmatrix}$ \Rightarrow $\begin{vmatrix} +\text{Voc} & +\text{Seg} \\ -\text{Con} & +\text{Con} \\ +\text{Dif} & +\text{Int} \\ +\text{Acu} & -\text{Fea} \end{vmatrix}$

7.36.
$$\begin{vmatrix} -\text{Ten} \\ -\text{Str} \end{vmatrix}$$
 +Voc $\begin{vmatrix} X \Rightarrow \\ +\text{Con} \\ -\text{Dif} \\ \alpha A c u \\ -\alpha F la \end{vmatrix}$ -Ten $\begin{vmatrix} +\text{Voc} \\ -\text{Con} \\ +\text{Dif} \\ \alpha A c u \\ -\alpha G r a \\ -\alpha F la \end{vmatrix}$

1876 · +15

7.37.
$$\begin{vmatrix} \underline{V}_1 & \underline{\cdot} & \underline{V}_2 \\ +\text{Voc} & -\text{Con} & +\text{Voc} \\ -\text{Con} & +\text{Int} & -\text{Con} \\ -\text{Ten} & -\text{Str} \end{vmatrix}$$

$$\begin{array}{c|cccc} \underline{V_1} & \underline{V_2} & \underline{} \\ | + \text{Voc} & | + \text{Voc} & | - \text{Con} & | + \text{Con} & | \\ | - \text{Con} & | - \text{Con} & | + \text{Int} & | \\ | - \text{Ten} & | - \text{Str} & | \end{array}$$

Examples are:

Note the non-assimilation of $\underline{\underline{t}}$ to the preceding $\underline{\underline{u}}$ in the following example, where $\underline{\underline{v}} = \underline{\underline{u}}$.

(7.39b) #muigá'# [muika'] 'he's going to shoot'

Examples are:

(7.40a)
$$\frac{\#t \ni i:+t\#}{\#n \ni :ht\#} \Rightarrow \frac{\#t \ni i:+t\#}{\#n \ni :ht\#} [n \ni :ht] 'woman'$$

7.41.
$$\begin{vmatrix} +\text{Voc} & +\text{Con} & \Rightarrow & | +\text{Voc} & +\text{Con} & | \\ -\text{Con} & +\text{Com} & | & -\text{Con} & -\text{Com} & | \\ +\text{Dif} & | & | +\text{Dif} & | & | \end{vmatrix}$$

An example is:

(7.41a) #čawi:qá'# ⇒ #čawi:ká'# [čawi:ka']
'he's going to gather'

Note that 7.41 does not apply to \underline{q} following a possessive prefix, because of the intervening $\underline{+}$. An example is:

(7.41b) <u>#ni+qab#</u> [niqab] 'my ear'

7.42.
$$\pm \Rightarrow \emptyset$$

7.43.
$$\begin{vmatrix} +\text{Voc} & | +\text{Con} & | -\text{Con} & | +\text{Con} & | +\text{Con} & | +\text{Con} & | +\text{Acu} & | +\text{Acu}$$

7.44.
$$\begin{vmatrix} \underline{V}_1 & \underline{V}_2 \\ +\text{Voc} & +\text{Voc} \\ -\text{Con} & -\text{Con} \\ \alpha \text{Fea} & \beta \text{Str} & -\gamma \text{Dif} \\ +\text{Acu} & -\text{Fea} \end{vmatrix}$$
 \Rightarrow $\begin{vmatrix} \underline{V}_1 \\ +\text{Voc} \\ -\text{Con} \\ \alpha \text{Fea} & \gamma \text{Con} \\ \beta \text{Str} & +\text{Acu} \\ -\text{Fea} \end{vmatrix}$

Examples are:

7.45. | +Ten | +Seg |
$$\#$$
 | \Rightarrow | \pm Ten | +Seg | $\#$ +Voc | +Con | +Acu | -Fea | $=$ | -Fea |

7.46.
$$\alpha Dif$$
 $| + Seg | # \Rightarrow | \alpha Dif | + Seg | # + Voc | + Con | - Con | + Dif | + Acu | - Fea | + Con | - Fea | + Con | + Co$

where if $\alpha = +$, then $\beta = -$

An example is:

(7.46a) $\# \check{c}aw \acute{e}(:) y \# \Rightarrow \# \check{c}aw \acute{e}(:) i \# [\check{c}aw \acute{e}(:) i]$ 'gather'

7.47.
$$\begin{vmatrix} \underline{i} & \underline{y} \\ -\text{Con} \end{vmatrix} + \text{Seg} \begin{vmatrix} \underline{\#} \\ +\text{Con} \end{vmatrix} + \text{Voc} \begin{vmatrix} +\text{Seg} \\ +\text{Dif} \end{vmatrix} + \text{Con} \begin{vmatrix} +\text{Dif} \\ -\text{Ten} \end{vmatrix} + \text{Acu} \begin{vmatrix} -\text{Dif} \\ -\text{Ten} \end{vmatrix} + \text{Acu} \begin{vmatrix} -\text{Ten} \\ +\text{Str} \end{vmatrix} + \text{Str} \begin{vmatrix} -\text{Fea} \\ -\text{Fea} \end{vmatrix}$$

7.48.
$$| \alpha Str | \Rightarrow \emptyset$$

7.49. |+Ten
$$|\# \Rightarrow$$
 |-Ten $|\#$

7.50.
$$\begin{vmatrix} \underline{V}_1 & \underline{V}_1 \\ +\text{Voc} & +\text{Voc} \\ -\text{Con} & -\text{Con} \\ \alpha \text{Fea} & \alpha \text{Fea} \end{vmatrix} \stackrel{\underline{V}_1(:)}{\leftarrow} X \Rightarrow \begin{vmatrix} \underline{V}_1(:) \\ +\text{Voc} \\ -\text{Con} \\ \alpha \text{Fea} \\ \pm \text{Ten} \end{vmatrix} \stackrel{\underline{X}}{\leftarrow} X$$

where
$$X = \#$$
 or $\#$

(7.50a)
$$\frac{\text{#nikii#}}{\text{#hamii#}} \Rightarrow \frac{\text{#niki(:)#}}{\text{#hami(:)#}} [\text{niki(:)}] 'my house (Acc)'$$

7.51.
$$\begin{vmatrix} \underline{\mathsf{V}} & \underline{\mathsf{V}} & \underline{\mathsf{V}} & \underline{\mathsf{V}} & \underline{\mathsf{V}} \\ -\mathsf{Voc} & -\mathsf{Voc} & \Rightarrow & -\mathsf{Voc} & -\mathsf{Voc} \\ +\mathsf{Con} & +\mathsf{Con} & & +\mathsf{Con} \\ -\mathsf{Dif} & +\mathsf{Dif} & & -\mathsf{Dif} & +\mathsf{Dif} \\ +\mathsf{Acu} & +\mathsf{Acu} & & +\mathsf{Acu} \\ +\mathsf{Int} & +\mathsf{Int} & & -\mathsf{Int} & +\mathsf{Int} \end{vmatrix}$$

An example is:

(7.51a) $\frac{\#n\dot{\imath}'a:\check{\xi}tam\#}{\#n\dot{\imath}'a:\check{\xi}tam\#}$ [$n\dot{\imath}'a:\check{\xi}tam$] 'my horses'

7.52.
$$\begin{vmatrix} +\text{Con} & +\text{Voc} & +\text{Dif} \\ +\text{Com} & +\text{Acu} & +\text{Acu} \\ +\text{Int} & +\text{Fla} & +\text{Ten} \end{vmatrix}$$
 \Rightarrow $\begin{vmatrix} +\text{Con} & +\text{Voc} & +\text{Dif} \\ +\text{Com} & +\text{Acu} & +\text{Acu} \\ +\text{Int} & +\text{Fla} & +\text{Ten} \end{vmatrix}$

Rule 7.52 affects only two known items:

Rule 7.52 does not affect $[q^{w}qi'mi'q]$ 'cough', presumably because the \underline{i} is short.

7.53.
$$|+\text{Ten}| \cap X \cap |+\text{Ten}| \Rightarrow |+\text{Ten}| \cap X \cap |\pm\text{Ten}|$$

where X does not contain ##

(7.54a) #wɨçɨhç# ⇒ #wɨçɨşç# [wɨçɨşç] 'man'
#≿ɨh≿ɨba'# ⇒ #≿ɨš≿ɨba'# [≿ɨš≿ɨba'] 'following'

7.55.
$$\begin{vmatrix} \pm & \underline{z} & \underline{z} \\ +\text{Seg} & -\text{Dif} \\ +\text{Con} & +\text{Acu} \\ +\text{Dif} & +\text{Int} \end{vmatrix} \Rightarrow \begin{vmatrix} -\text{Dif} \\ +\text{Acu} \\ +\text{Int} \end{vmatrix}$$

An example is:

(7.55a) #'atuh^wtčinim# ⇒ #'atuh^wčinim# ['atuh^wčinim] 'older ones'

7.56.
$$\begin{vmatrix} \underline{C}_1 \\ +Con \\ \alpha Fea \end{vmatrix} \xrightarrow{\underline{C}_1} \begin{vmatrix} \underline{C}_1 \\ +Con \\ \alpha Fea \end{vmatrix} \Rightarrow \begin{vmatrix} \underline{C}_1 \\ +Con \\ \alpha Fea \end{vmatrix} \xrightarrow{\underline{C}_1} \begin{vmatrix} \underline{C}_1 \\ +Con \\ \alpha Fea \end{vmatrix}$$

The deletion of one of two identical consonants across a word boundary is usually not indicated in the phonetic transcription. An example of this deletion is:

(7.56a) $\#h^{W}$ ukahti#m#m#mikan#mikan#mikan#mikan#mikan#mikan#mikan#mikan#mikan#mikan#mikan#mikan#milled a deer.'

Examples are:

The symbol ['W] is not used (cf. 7.7). An example with labialized glottal stops is:

$$(7.57b)$$
 ['u:'] (= [' W u'' W]) 'take'

7.58.
$$\#$$
 |+Con | $\#$ |+Seg | \Rightarrow $\#$ |+Con | $\#$ |+Seg |+Con |+Com |+Com |-Fea |

(7.58a)
$$\#t\# \cap \#h\# \Rightarrow \#t\#\#X\# [t X] 'Dubitative \cap Inferential$$

(Evidentials) ' (see (1.4 t))

 $\#t\# \cap \#hi:t\# \Rightarrow \#t\#\#Xi:t\# [t Xi:t] 'something'$

(see (1.21c))

7.59.
$$\begin{vmatrix} +\text{Nas} \\ +\text{Dif} \\ +\text{Acu} \end{vmatrix} \begin{vmatrix} \# \\ +\text{Seg} \\ +\text{Int} \\ +\# \\ +\text{Fla} \\ -\text{Fea} \end{vmatrix} \Rightarrow \begin{vmatrix} +\text{Nas} \\ +\text{Dif} \\ +\text{Acu} \end{vmatrix}$$

An example is:

(7.59a) $\#k^{W}\pm n\#\#'i\check{c}u'kin\#\#'amai\# \Rightarrow \#k^{W}\pm n\#\#i\check{c}u'kin\#\#amai\#$ QUOT MAKE THAT

[$k^{W}\pm n$ iču'kin amai.] 'She made that.'

Word-initial glottal stop is often not pronounced.

7.61. ± ⇒ Ø

Word boundaries, in my experience, are inaudible. They are indicated in the phonetic transcription by spaces, as noted

in section 0.2, only for the convenience of the reader.

Examples are:

- (7.62a) # $\frac{hak^{W}up}{vu:'i'ac} \frac{k^{W}\pm n}{k^{W}\pm n} \Rightarrow #\frac{hak^{W}upiyu:'i'ac}{k^{W}\pm n}$ VERY CRIER QUOT

 [hak wupiyu:'i'ac k \frac{k}{\pm}\pm in.] 'He was quite a crybaby.'
- (7.62b) #...'ani k^wini houk^wpi wia:n# ⇒

 AND-THEN QUOT-PLURAL ONE-ACC SEND

 #...'ani k^wini houk^wpiuwia:n#

 [...'ani k^wini houk^wpiuwia:n.]

 '...and then they sent one [man].'

7.63.
$$\begin{vmatrix} \pm Voc \\ +Con \\ +Int \end{vmatrix}$$
 \Rightarrow $\begin{vmatrix} \pm Voc \\ +Con \\ \pm Int \end{vmatrix}$

r is freely a tap or an apicoalveolar approximant. This difference is not indicated in the transcription.

An example illustrative of both 7.64 and 7.64 is:

APPENDIX: Summary of Phrase-Structure Rules.

1.1. S
$$\rightarrow$$
 { Interjection S ([#Conj \cap S#]*) }

1.2. S
$$\rightarrow$$
 ([Adv]*) NomP \cap PredP \cap Aux 13

1.3. Aux
$$\rightarrow$$
 Asp \sim EvP

1.4. EvP
$$\rightarrow$$
 (Ev) ($\frac{\# \tan \#}{}$) Ev ($\frac{Past}{}$) ($\frac{?}{}$)

1.6. Pred
$$\rightarrow \left\{\begin{array}{c} \text{NomP} \\ \text{NumP} \end{array}\right\}$$
 26 ([TS]*)(Intens) $\left\{\begin{array}{c} \text{AdjP} \\ \text{(Manner) VblP} \end{array}\right\}$

1.7. Adv
$$\rightarrow \left\{ \begin{array}{c} Adv_{S} & (Adv_{TS} \cap \#S\#) \\ TS \end{array} \right\}$$
 30

1.8. TS
$$\rightarrow$$
 ($\left\{\begin{array}{c} NomP & (\underline{y} \ni \#) \\ NumP \\ \#S\# \end{array}\right\}$) Adv_{TS} 32

1.9. Manner
$$\rightarrow \left(\left\{ \begin{array}{c} NomP \\ AdjP \\ \lceil \#S \# \rceil * \end{array} \right\} \right) Adv_{manner}$$
 35

1.10.
$$VblP \rightarrow (BenP) VP \cap Aux_V$$
 36

1.11.
$$Aux_V \rightarrow (Freq)(\underline{cu'a\#})\underline{y}$$
 37

1.12.
$$VP \rightarrow \left(\left\{ \begin{array}{c} (NomP) \left\{ \begin{array}{c} NomP \\ N \\ AdjP \end{array} \right\} \right\} \right) V (PunctP)$$
 40

1.13. AdjP
$$\rightarrow$$
 ($\left\{\begin{array}{c}N\\V\text{ (PunctP)}\end{array}\right\}$) Adj

1.14. PunctP
$$\rightarrow$$
 $(\pm '\pm \#)$ $q \ni \#$ 46

1.16. NomP
$$\rightarrow$$
 Nom ([(Conj) Nom]*) 49

1.17. Nom
$$\rightarrow \left\{\begin{array}{c} \text{(Intens)(DP) NP} \\ \text{\#S\#} \end{array}\right\}$$
 51

1.18. NP
$$\rightarrow$$
 (NomP) (#S#) N 52

1.19. NumP
$$\rightarrow$$
 ($\left\{\begin{array}{c}D\\PreNum\end{array}\right\}$) Num 55

1.20.	PreNum	>	$NumP \cap Adv_{TS}$			
1 21.	DP →	(Pr	eD) (D)	D		58
